# INDEX

CANADIAN MINING JOURNAL, VOL. 30.

JANUARY 1, 1909, TO DECEMBER 31, 1909.

- E. Editorial. \* Illustrated.
- Accidents, Mining, 194. E.
- Accidents, Mine, 34. E.
- Accidents, and Their Prevention, Coal Mine, by J. A. Holmes, 755.
- Advertising, 163. E.
- Aeneas McCharles, 227. E.
- Agalmatolite—Pseudo Talc, 525.
- Aganico Mines Development Co., The, 24, 25; 130, 131. E.
- Agriculture and Mining, 163. E.
- Alaska-Yukon-Pacific Exposition, The Mineral Exhibits at the, by E. Jacobs, 483-7.\*
- Alberta, Coal Mining in, During the Year 1908, 292-295.\*
- Alberta, Exams. Under The Coal Mines Act, Prov. of, 302-5.
- Alberta, Natural Gas in, 200-201.
- Amalgamated Asbestos, 354. E.
- Amalgamated Asbestos Corporation, Limited, The, by J. J. Harpell, 356-359.
- American Coal Invasion, The, 129-130. E.
- American Institute of Mining Engineers, by E. Jacobs, 652-658.
- American Mining Congress—Provisional Programme, 558-589.
- Annual Report of the Ontario Bureau of Mines, The, 676. E.
- Another Claimant for the Pole, 210. E.
- Aplite, 229. E.
- Aplite, Gold in, 240-241.
- Aplites, Composition of the, by N. L. Bowen, 240.
- Applications of Concrete in the Metal Mining Industry, by H. W. Edwards, 679-682.\*
- Arctic Amenities, 597.
- Arithmetic, 355. E.
- Asbestos Merger, The, 385-386. E.
- Asbestos Merger, The Recent, 273-275.\*
- Asbestos Deposits, Depth of, by Fritz Cirkel, M.E., 132-135.\*
- Asbestos in Canada, The Production of, by John McLeish, B.A., 714-717.
- Asbestos Once Again, 418. E.
- Ashworth, John, on A British View of Western Canada, 230-233.
- Atlin, British Columbia, 1898-1908, Mining in, 533-534.
- Baker, M. B., on Our Visible Supply of Brick, 100-102; on Our Substitute for Timber, 339-340.
- Barnstead, A. S., on The Minerals of Nova Scotia During 1908, 70-72.
- Bartlett, J. M., on Notes on Gold Discoveries in Whitney and Tisdale Townships, 683.
- Baszanger, Jacques, on Carbons (Black Diamonds) for Diamond Drills, 78.
- Bett's Cove Mine, 458-459.\*
- Blair, Andrew A., on Note on the Determination of Carbon and Phosphorous in Steel, 401-403.
- Books, 99. E.
- Book Reviews, 54, 55, 85, 118, 146, 147, 210, 211, 242, 275, 341, 342, 374, 375, 469, 470, 501, 502, 596, 756-757.
- Bowen, N. L., on Composition of the Aplites, 240.
- "Brat" Oxygen Reviving Apparatus, Successful Use of the, 146.
- Brick, Our Visible Supply of, by M. B. Baker, 100-102.
- British Association for the Advancement of Science. The Winnipeg Meeting of the, by Cyril W. Knight, 644-648.\* 690.
- British Columbia, Annual Report of the Provincial Mineralogist for the Year Ending Dec. 31st. 1908, Being an Account of Mining Operations for Gold, Coal, etc., in the Province of, 423-426.\*
- British Columbia Copper Company's Mother Lode Mines. Mining Methods and Equipment at the, by M. D. McIntosh, 167-168.
- B. C. Mining Around Kaslo, by E. Jacobs, 259-262.\*
- British Columbia, Southeastern, 4-7.
- British Columbia, Special Correspondence, 60, 90, 122, 123, 153, 154, 186, 187, 217, 218, 251, 252, 284, 285, 315, 316, 347, 348, 378, 379, 409, 410, 443, 444, 476, 477, 507, 508, 540, 541, 571, 572, 602, 603, 634, 635, 667, 668, 699, 700, 731, 732, 764, 765.
- British Columbia Zinc Ores and the U. S. Tariff 355. E.
- British and German Iron and Steel Trade, 673. E.
- British Empire. Coinage in the, by J. J. Harpell, 300-302.
- British Mint, Annual Report, The, 468, 469.
- British Mint in 1663, The, 116-117.
- British View of Western Canada, A, by John Ashworth, 230-233.
- Brock, R. W., on Wanted—An Inventory of Promising Mineral Claims, 233-4; on Hugh Fletcher, 677-678.
- Brown, J. Steversou, the Retiring Treasurer of the C. M. I., 23.
- Browne, D. F., on Canadian Copper Company, 42-46.\*
- Brumell, H. P. H., on Graphite Concentration, 267-272.\*
- Brunton, David W., on Modern Practice of Ore Sampling, 516-525.\*
- Bulkley Valley and Vicinity, The, by W. W. Leach, 372-374.
- Bullen, John Ravenor, on The Song of the Oil-Well Driller, 241.
- Bureau of Mines, Ontario, in 1908, by T. W. Gibson, 83.
- Burrows, A. G., on South Lorraine Silver Area, 434-437.\*
- Caldecott, W. A., on "The Development of Heavy Gravitation Stamps, 588-594.
- California, Gold and Silver Production in, 684.
- Canada, 1907-8, Report on the Mining and Metallurgical Industries of, 79-82.\*
- Canada in 1908, Preliminary Report of the Mineral Production of, by John McLeish, 171-174.\*
- Canada and America, 130. E.
- Canada's Arctic Domain, 675. E.
- Canadian Banking, 227-229. E.
- Canadian Copper Company, by D. F. Brown, 42-46.\*
- Canadian and English Company Law, 686-688.
- Canadian and English Company Law, 743.
- Canadian Mining Industry at Duesseldorf, Germany, Lecture on, 16.
- Canadian Mining Institute, 35. E.
- Canadian Mining Institute Eleventh Annual Meeting, 69.
- Canadian Mining Institute, The Retiring Treasurer of the, 22, 23.\*
- Canadian Mining Institute, The Western Branch of The, 99. E.
- Canadian Mining Institute, The, 161, 162. E.
- Canadian Mining Institute, Eleventh Annual Meeting of The, 163-166.
- C.M.I. Annual Dinner, Earl Grey's Address at The, 198, 199.
- C.M.I., Meeting of the Cobalt Branch of, 306.
- C.M.I., New Members, 532, 533.
- Canadian Mining Institute, Some Notes on the History and Recent Development of The, by H. Mortimer-Lamb, 585-588.
- C.P.R. Collieries in the West, by Lewis Stockett, 7, 8, 9.
- Canadian Patents, 469, 561, 596, 628, 662, 691, 724, 757.
- Carbons (Black Diamonds) for Diamond Drills, by Jacques Baszanger, 78.
- Carey, Elmer E., on Electrochemical Plate Amalgamation, 649-652.
- Chambers, A. R. and R. E., on Sinking of Wabana Submarine Slopes, 110-114.\*
- Change of Heart, A, 546. E.
- Chrome Deposits, Report on, 559.
- Chrome Iron Mines, The, 25, 26.
- Cirkel, Fritz, on Depth of Asbestos Deposits, 132-135.\*
- Cirkel, Fritz, on Report on the Iron Ore Deposits Along the Ottawa and Gatineau Rivers, 739.
- Coal, The Action of Organic Sulphur In, During the Coking Process, by A. L. McCallum, 531-532.
- Coal Areas of Newfoundland, by James P. Howley, 453-457.\*
- Coal-Cutting Machines, 532.
- Coalfields and a Canadian Navy, The, 708. E.
- Coal, The Formation of, 386. E.
- Coal, Free Trade in, 193, 194. E.
- Coal and Iron Ore Supplies of U.S.A., The, 258. E.
- Coal Lands, Government Valuation of, 469.
- Coal Mine Accidents and Their Prevention, by J. A. Holmes, 755.
- Coal Mines Act, Province of Alberta, Examinations Under The, 302-305.
- Coal Mines, European, by J. W. Paul, 428.
- Coal Mines, Rescue Work in, 170.
- Coal Mining in Alberta during the year 1908, 292-295.\*
- Coal Mining Industry for 1908, a Resume of the Nova Scotian, 36-39.
- Coal Mining in South-Western Virginia, by D. A. Patterson, 390-392.\*
- Coals, Petroleum and, by Eugene Coste, 295-300, 330-334.
- Coal, Pressure in the Formation and Alteration of, by D. B. Dowling, 102-104.
- Coal, Purchasing under Specifications, 306.
- Coal, Reciprocity in, a Western Point of View, by E. Jacobs, 462-468.
- Coal-Steel Merger, The, 705. E.
- Cobalt in 1908, A. A. Cole, 323-329.\*
- Cobalt, A Custom Sampler for, 578. E.
- Cobalt, Early Days in, by W. G. Trethewey, 20-24.\*
- Cobalt Hydraulic Company, The Plant and Equipment of the, 611-617.\*
- Cobalt, Impressions of, 212.
- Cobalt Mines Power Ltd., Cobalt, Power Development in, 461.
- Cobalt Ores, Concentrating and Smelting, 322. E.
- Cobalt Ores, Sampling of, 387. E.
- Cobalt Ores, Sampling of, by Dr. A. R. Ledoux, 388-389.
- Cobalt, Power at, 429, 430.
- Cobalt, Ont., The Projected Custom Sampling Plant, to be Erected in, 580-584.\*
- Cobalt Silver Belt, The Widening of the, by Frank C. Loring, 237, 238.
- Coinage in the British Empire, by J. J. Harpell, 300-302.
- Coking Oven, Genesis and Development of the, by W. Galloway, 527-530.
- Coke Oven at Sault Ste. Marie, The Koppers By-Product, 757.
- Cole, A. A., on Cobalt in 1908, 323-329.\*
- Collieries in the West, C.P.R., by Lewis Stockett, 7, 8, 9.
- Collins, W. H., on Gowganda Mining Division, District of Nipissing, Ontario, 369-371, 392-394.\*
- Colorado Coal, 306.
- Colville, Andrew, Obituary, 535.
- Company Notes, 31, 62, 92-94, 126, 158, 159, 190, 191, 221, 222, 287, 318, 350, 351, 381, 382, 412, 413, 416, 446, 447, 510, 543, 606, 637, 638, 670, 671, 703.
- Composition of the Aplites, by N. L. Bowen, 240.
- Concerning Geological Reports, 353-354. E.
- Concrete in Metal Mining, 675. E.
- Concrete in the Metal Mining Industry, Applications of, by H. W. Edwards, 679-682.\*
- Conference, North American Conservation, 225, 226. E.
- Conflicting Fixtures, 131. E.
- Contradiction, A, 35. E.
- Copper Country, In the Michigan, by R. E. Hore, 421, 422.\*
- Copper Mining in Canada, Some Recollections of Early, by Dr. James Douglas, 68, 69.
- Copper Resources of Vancouver Island, The, 579. E.
- Cornish Tungsten Ore, 643.
- Correction, A, 35. E.
- Correction, A, 483. E.
- Correspondence, 56-58, 118, 119, 120, 148, 151, 183, 211, 212, 243-245, 277-279, 308, 376, 404, 405, 471, 472, 535-537, 565, 566, 694, 727.
- Coste, Eugene, on Petroleum and Coals, 295-300, 330-334.
- Covington Coke Drawing and Loading Machines, 399-401.\*
- Crown Reserve Mining Co., Ltd., The, 9, 10.\*
- Crown Reserve Mining Co., 151.
- Cumming, J. D., on Gowganda Notes, 229.
- Cumming, J. D., on The Lumber Situation in Gowganda, 278.
- Cumming, J. D., on Discovery, 584.
- Cyanide Treatment of Slimes, A Proposed New System for the, by Ferdinand McCann, 548-550.
- Davis, H. P., on The La Rose Dump, 560, 561.
- Department of Mines, Province of Nova-Scotia, 1908, Report of the, 202-204, 238-240.\*

- Department of Trade and Commerce, The, 210. E.  
 Department of Trade and Commerce—Special Note to the Press—Note and Circular Issued by the, 628.  
 Depth of Asbestos Deposits, by Fritz Cirkel, M.E., 132-135.\*  
 Descriptive Sketch of the Geology and Economic Minerals of Canada, A. by Dr. G. A. Young, 684-686.  
 Determination of Carbon and Phosphorus in Steel, Notes on the, by Andrew A. Blair, 401-403.  
 Development of Heavy Gravitation Stamps, The, by W. A. Caldecott, 588-594.\*  
 Dictionary of Chemical and Metallurgical Material, A, 525.  
 Dikes and Veins, 34. E.  
 Discovery, by J. D. Cumming, 584.  
 Discovery and Assessment, 162. E.  
 Dividends, Quarterly, 514. E.  
 Dominion Coal Co., The Mining Operations of, by F. W. Gray, 10-16, 177-182, 235-237.\*  
 Doric Reserve Mines, Limited, 643. E.  
 Douglas, Dr. James, on Some Recollections of Early Copper Mining in Canada, 68, 69; on Reciprocity in Coal, 277, 278; on The Influence of the Railroads of the U.S. and Canada on the Mineral Industry, 490-496.  
 Dowling, D. B., B. Sc., on Suggestions as to the Use of Contoured Maps, 41, 42; \* on Pressure in the Formation and Alteration of Coal, 102-104.  
 Drafts in Steam Boiler Practice, 234.  
 Dredges, Evolution of, 617, 618.  
 Dresser, John A., of Mineral Deposits of the Serpentine Belt of Southern Quebec, 334-339, 365-368.\*  
 Duncan River Country, B.C., The, 578. E.
- Earl Grey's Address at the C.M.I. Annual Dinner 198, 199.  
 Early Days in Cobalt, by W. G. Trethewey, 20-24.\*  
 Editorial Notes, 68, 131, 163, 229, 259, 291, 355, 356, 420, 451, 452, 515, 547, 611, 643, 676, 739.  
 Edwards, H. W., on Applications of Concrete in the Metal Mining Industry, 679-682.\*  
 Eight Hours Day, The, 322. E.  
 Eighteenth Annual Report of the Ontario Bureau of Mines, 1909, 718-724.  
 Electricity in Mines, by T. J. McKavanagh, 206-208.  
 Electric Mine Hoist, A Remarkable German, by F. C. Perkins, 394, 395.  
 Electric Smelting of Iron Ores, 559, 560.  
 Electrochemical Plate Amalgamation, by Elmer E. Carey, 649-652.  
 Electrochemical Plate Amalgamation and Ionized Gold, 694.  
 Electrometallurgy of Iron and Steel, The, by Dr. Stanfield, 205.  
 Electrometallurgy of Iron and Steel, The Progress of, by Dr. A. Stanfield, 83-85.  
 Eleventh Annual Meeting of the Canadian Mining Institute, 163-166.  
 Elimination of Politics, 194. E.  
 English Engineer's Advice, An, 257. E.  
 English Opinion of Mining in Northern B.C. and the Yukon, 754.  
 European Coal Mines, by J. W. Paul, 428, 429.  
 European Petroleum, 758.  
 Examinations Under the Coal Mines Act, Province of Alberta, 302-305.  
 Exchanges, 55, 56, 85, 117, 118, 182, 242, 275, 276, 307, 342, 343, 375, 439, 440, 534, 535, 562, 595, 596, 629, 630, 661.  
 Explanatory, 579. E.  
 Export Bureau, 628.
- Fairy Gold, 610. E.  
 Fées and the Man, 66. E.  
 Field Work of the Geological Survey of Canada, 46-48.  
 Filtering Gold Slime, 557, 558.  
 Fletcher, Hugh, 609. E.  
 Fletcher, Hugh, by R. W. Brock, 677, 678.  
 Fluxes for Silver Tailings, 305.  
 Fralick, Ernest Leigh, by J. C. Murray, 364, 365.\*

## Air Compressors

SULLIVAN duplex, two-stage, belt-driven Air Compressors, Class "WJ" are designed for continuous operation for long periods without attention. The main working parts are housed to keep out dust and grit, and are oiled automatically by a combined well and gravity return system. Compression of the air in two stages secures high efficiency.

The electric air power system of the Cowanshannock Coal and Coke Co., Yatesboro' Pa., of which the compressors shown here are a part, is described in "Mine and Quarry." **It will interest you.**

## Duplex Tandem Power Driven Compressors

The demand which has arisen in recent years for large power driven compressors for electric motor drive has presented new problems, the two most important being the method of driving and the method of unloading.

These large electrically driven machines must run at constant speed while the amount of air compressed must be varied to suit the requirements. In many cases the charge for electric power is based on the maximum demand. Where such is the case it is very desirable that the compressor should be capable of running continuously at part load. Our duplex tandem machine Class D2-T is especially adapted for this class of work as it will run con-

tinuously at full load, three-quarter load, half-load, one-quarter load or no load. At every one of these stages the proper cylinder proportions are maintained for the most efficient compound compression.

The unloading is accomplished by holding open the inlet valves of the cylinders, allowing the air to blow freely in and out of the cylinders, thus allowing the cylinders to cool off. As a result the machine delivers cooler air, thus reducing the work of compression.

Each stage of unloading not only reduces the amount of air compressed, but also reduces the pressure on the bearings, thereby reducing the wear of the machine.

This duplex tandem compressor with four-stage unloader represents the most efficient and economical type of large motor-driven air compressor.

# Dry Concentration

## ABSOLUTELY DUSTLESS

# The Behrend System

THE Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor.

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

WRITE US FOR DESCRIPTIVE PAMPHLET.  
FORWARD SAMPLE OF YOUR ORE FOR PRELIMINARY TEST

### CIRCULATION.

During the year ending with March 1st, 1908, 91,750 copies of "The Canadian Mining Journal" were printed and distributed, an average of 3,822 per issue.

"Entered as second-class matter April 23rd, 1908, at the post-office at Buffalo, N.Y., under the Act of Congress of March 3, 1879."

### SPECIAL CONTRIBUTORS.

**Geology:** Dr. Frank D. Adams, McGill University; Dr. A. E. Barlow, late of Geological Survey of Canada; Professor Willett G. Miller, Provincial Geologist of Ontario; Dr. J. E. Woodman, Dalhousie University, Halifax, N.S.

**Chemistry:** Dr. W. L. Goodwin, Director School of Mining, Kingston, Ontario; Milton Hersey, M.Sc., Official Analyst Province of Quebec.

**Mineralogy:** Professor W. Nicol, School of Mining, Kingston, Ontario.

**Mining:** S. S. Fowler, M.E., Nelson, B.C.; Frederick Keffer, M.E., Anaconda, B.C.; A. B. Willmott, M.E., Sault Ste. Marie, Ont.; J. C. Gwillim, M.E., School of Mining, Kingston, Ont.; J. Obalski, Inspector of Mines, Quebec; J. Bon-sal Porter, M.E., McGill University; H. Mortimer-Lamb, Sec. Can. Min. Inst.; John E. Hardman, M.E., Montreal; Fritz Cirkel, M.E., Montreal; George W. Stuart, M.E., Truro, N.S.

**Metallurgy:** Stafford F. Kirkpatrick, School of Mining, Kingston, Ontario; A. P. Scott, Dominion Iron & Steel Company, Cape Breton.

**Natural Oil and Gas:** Eugene Coste, M.E., Toronto, Ont.

## THE YEAR 1908.

### A Review.

Looking over the mining history of the Dominion during 1908, there are more than a few notable events that have influenced the trend of investment and of energy.

We shall not be called to task for placing the activities of the Canadian Mining Institute first in order of importance. When the proposal to invite a large number of foreign mining engineers and technologists to Canada was first discussed, there were many difficulties in the way. The large expense incident to a tour that was to cover Canada from Sydney to Victoria seemed beyond the available means of the Institute. Other objections were urged. But the enthusiasm of the executive officers never wavered. The Federal and Provincial Governments were approached, and their aid was secured. The railways granted special rates. And so it came to pass that the Summer Excursion of the Canadian Mining Institute for 1908 will go down into history as an affair of international importance. Canada has never received such an absolutely effective advertisement of her mineral resources.

The Federal Department of Mines, under the careful hand of the Hon. Mr. Templeman, has played its part during the past year. Between it and the Canadian Mining Institute there is harmony. Both are factors in promoting the welfare and increasing the solidarity of the mining industry. The Department, which as a distinct administrative entity is scarcely two years old, is gaining in strength daily. The numerous strong requests that have been sent to Ottawa urging the retention of the Hon. Mr. Templeman as Minister of Mines are significant of a national interest in the work of the Department.

Recognition of the need of better facilities for technical education has been manifested east and west. In Nova Scotia a comprehensive system of instruction has been organized, and a well-equipped institution of technology is nearing completion at Halifax. This will put within the reach of the rising generation of the Maritime Provinces the opportunity of taking a larger part in the development of their own country. The mining departments of McGill and Queen's are overflowing with students, and the University of Toronto has entered upon the field with renewed vigor. In the west, British Columbia is hastening to provide the machinery for turning out her own mining men, and without doubt the new provincial universities of Saskatchewan and Alberta will include practical branches in their curricula. The prospects for

secondary technical education in Canada are therefore brighter than ever before.

The mineral production of Nova Scotia for 1908 has exceeded that of 1907 by a good margin. The volume of the St. Lawrence coal trade was larger than ever before. The quarrel between those two great concerns, the Dominion Coal and the Dominion Steel, has had the effect of stimulating both to the keenest activity. The latter corporation has entered the foreign markets, and has captured Oriental contracts against British competition. The Nova Scotia Steel and Coal Company, despite the continued depression, has had a good year. So also have all of the smaller coal producers. The gold industry has lost no ground, but has, indeed, gained in several respects. In all branches of the mineral industry labor troubles have been practically absent.

New Brunswick possesses now the rudiments of a large iron industry. Development of the Bathurst iron ore deposits has been most encouraging. In coal mining there has been material progress, although on a very limited scale. However, New Brunswick's possibilities are being more thoroughly advertised. The Province requires a Department of Mines.

The asbestos production of Quebec is waxing steadily. As will be noticed in articles on another page, the productive area of the asbestos regions is extending, and new mills are being erected. The mining and milling of chrome ore, discouraged for a time by the inactivity of the iron industry in the United States is now showing signs of vigorous new life. The enormous hinterland of Northern and Western Quebec is still unexplored. It is possible that a change in administrative policy might have a beneficial effect upon this vast region.

The Province of Ontario has made undeniable advances in several directions. Cobalt has become a mining camp of solid reputation. The Montreal River districts, despite the pernicious activities of fakirs, have fulfilled their early promise, and now await sane development. This will come gradually, along with the subsidence of the stock boom. The production of silver in Ontario, which at present is practically confined to Cobalt, will exceed that of 1907 by nearly fifty per cent. in value, notwithstanding the serious drop in the price of silver. From the great copper-nickel field of the Sudbury region the usual production is expected. Here and at several other points in Ontario the mining of iron pyrites, which mineral is surely replacing Sicilian sulphur in the manufacture of pulp, has been carried on. Another subordinate mineral, talc, is being mined and milled on a much larger scale. The low demand for mica has reacted unfavorably upon its production in this Province. Perhaps the most significant development of the year is the completion of smelters for treating Cobalt ores. The establishments at Deloro and at Thorold have now been in full operation for some time. Ontario's total mineral production for 1908 will show a most gratifying increase.

The Albertan coal fields attracted much attention during the year. While new producers are constantly

entering the field, production has not been seriously augmented, although there has been a normal increase. Another year, however, will see many of these new producers attaining outputs up to the capacity of their plants. In other words, the coal industry of Alberta is yet in the early stages of construction. But the basis of a broad industry is being laid. The Provincial Government is thoroughly alive to the necessity of close inspection of collieries and to the need of departmental supervision.

Mining and its kindred industries are taking a new lease of life in British Columbia. Although last spring's abnormally low copper prices threatened the suspension of the larger producers in southeastern districts, outputs have been not only maintained, but increased. The Dominion Copper Company has fallen by the wayside, but not without hope of recovery. The Consolidated, the Granby, the B. C. Copper, the mines of Rossland, Nelson, and the Boundary, have more than held their own. As in the other provinces, there has been peace between employer and employed. The Fernie fire, a disaster of the first magnitude, caused but a small disturbance in the production of coal and coke. On another page the general progress of mining in British Columbia is well summed up. There are two incidents that must not be omitted here, however. These are the extension of the lead bounty, and the successful establishment of an electric reduction plant for the treatment of zinc ores at Nelson. Both of these events mean much to the miners of West and East Kootenay. In general, it may be said that, owing to carefully administered mining legislation, the constant support of local newspapers, and, by no means last, the character of the men most prominent in the management of the various enterprises, British Columbia's mining industry has been placed in such a condition that its continued growth is assured.

From the Yukon come reports of larger gold yields. These reports do not lack official confirmation. But details will not be published until early in February.

The field of mining in Canada is so tremendous that any editorial review must needs be superficial. But even a casual glance will detect the unmistakable signs of lusty youth in Canadian mining. Here it may be pointed out that there exists urgent need of co-operation between the Federal and the Provincial Governments in many matters pertaining to our industry. Uniformity in statistics and in mining regulations is a crying need. Co-operation in adopting measures for advancing various branches of mining is becoming more and more desirable. This may be illustrated by the effect of Ontario's drastic and praiseworthy treatment of wildeats. Since it is no longer possible for the spurious promoters to advertise in Ontario newspapers, he has turned attention to the newspapers of Montreal and other parts of Quebec. Again, the subject of prevention of mine accidents is one that all the Governments might well consider. In fact, there are many

directions in which co-operation of this kind is absolutely necessary.

Among the more important enterprises launched during the year are the Canada Iron Corporation, Limited, and the German Development Company, Limited. These two concerns are widely different in aims and scope. But both should have a large part to play in the development of our mineral resources.

We have alluded above to the good effects that are traceable to the trans-continental tour of the Canadian Mining Institute and its guests. One of these effects was the rectifying of much misinformation that was current on the other side of the Atlantic. It is not out of place here to make appreciative mention of the vigorous work of an occasional contributor to these pages, Mr. Alex. Gray, now of Montreal. Mr. Gray, as Canadian correspondent to several foreign technical papers, including the Mining Journal, of London, England, has accomplished a great deal towards correcting misconceptions and diffusing the truth concerning Canadian mining affairs.

In conclusion, we wish our readers a New Year happier and more prosperous, if possible, than the year that has passed. We are most thankful to know that this wish will include almost twice as many of our fellow-men as was the case one year ago.

#### **THE GERMAN DEVELOPMENT COMPANY, LIMITED.**

The investment of British and European capital in the mining industry of Canada has not always been attended with fortunate consequences. Needlessly profuse expenditure upon overground equipment, unnecessarily large staffs, lack of competent Canadian advisers, coupled with extravagant expectations, have usually had much to do with the failures. Moreover, it is true that in transit across the Atlantic a mining scheme loses nothing in size. In fact, we have known of Canadian properties that could not have been sold for \$10,000 in Toronto or Montreal forming the *raison d'être* of a £250,000 flotation in London. This kind of thing invites disaster.

Messrs. Frecheville and Marriott, in a paper entitled "A Visit to the Mineral Districts of Canada," speak most favorably of Canada as a field for mining enterprise. "Results in the past, it is true," these distinguished engineers conclude, "have not been uniformly encouraging, but this was probably more due to the methods adopted than to an absence of conditions for profitable working. . . English capitalists would, we believe, stand a much better chance of securing some of the good things . . . if, instead of waiting to have them brought over to London, they had an agent or representative resident in London." To this we may add that the representative chosen by foreign investors should be a mining engineer or mining geologist, preferably a Canadian or an acclimatized English-

man. We may remark that the process of acclimatization is rarely complete, although it is but simple justice to say that the Englishman who knows Canada and Canadians thoroughly is often the most competent man that can be secured.

With this introduction we wish to notice a publication that has a more than usual claim upon our attention.

The first annual report of the German Development Company, Limited, is a pamphlet of 82 pages. It is well illustrated with plans, maps and sections. It is admirably arranged, carefully edited, responsible and dignified in tone.

Scarcely two years ago it was announced that the German Development Company, whose chief stockholders are citizens of Berlin, Germany, had engaged Dr. A. E. Barlow to superintend the acquisition of mineral lands in Canada. Later, it was learned that Mr. D. B. Dowling was to undertake the duty of selecting suitable coal lands in the Rocky Mountains, and this year Mr. James McEvoy was selected to report upon the coal areas already acquired by the company.

It is to be noted that Mr. Martin Cohn, the managing director of the German Development Company, chose as the men who were to direct the activities of his company three Canadians, mining men of the highest standing. Dr. A. E. Barlow, whose name is well known on both sides of the Atlantic, did much brilliant work during his connection with the Geological Survey of Canada. His monograph on the Sudbury ore deposit is a classic. Mr. D. B. Dowling, like Dr. Barlow, a senior member of the staff of the Geological Survey, is a recognized authority upon the coal-measures of Western Canada. As a former member of the Survey staff and as geologist and chief engineer to the Crow's Nest Pass Coal Company Mr. James McEvoy had attained a sound reputation.

And the report before us is thoroughly in keeping with the standards to be expected from men of this class. A large folding map of the Dominion shows in red the situation of the coal lands owned and leased by the company in Alberta, and the silver areas staked in Ontario. The map also displays the main established and projected lines of railway communication.

The reports of Dr. Barlow on certain claims in the Montreal River Mining Division and upon others near Miller and Everett Lakes are followed by the reports of Messrs. Dowling and McEvoy upon the Kananaskis and Bighorn and Brazeau coal lands. Each of these reports will be given fuller attention in this and succeeding numbers of the Canadian Mining Journal. It is appropriate to allude here, however, to the businesslike, methodical, and satisfactory manner in which all of them have been prepared. There is no hyperbole. Each report is a careful, painstaking record of observed facts, and logical, professional deductions.

The probable cost of mining, labor, transportation, timber supplies and markets is fully set forth. The

results of the coal analyses conducted by Dr. Milton Hersey, of Montreal, are presented in such form as to afford a valuable comparison with other Canadian fuels. And it is pleasing to notice that there is a sharp line drawn between "samples" and "specimens." The point of view of each report is economic. None of the reports falls in any respect below the standard that obtains in the publications of the Geological Survey. The attention paid to commercial possibilities will, perhaps, prove suggestive to those of our official geologists who lean too strongly to the purely academic.

It is evident that the German Development Company is building the foundations of a strong enterprise safely and soundly.

### TO OUR READERS.

This number of the Canadian Mining Journal contains some first-hand information from several important mines. The historical sketch of the famous Crown Reserve, of Cobalt, Ontario, is the first authentic statement that has been issued concerning that mine. The summary of operations at the Trethewey mine is instructive. Ten months ago the Trethewey was looked upon as being in a more or less dubious position. Now it is strongly entrenched in the forefront of producers. For this both President A. M. Hay and Manager G. F. McNaughton deserve credit. And this can be given without casting aspersions upon anyone. The simplicity of the system of ore treatment at both the Crown Reserve and the Trethewey is to be commended.

The report of La Rose Consolidated contains much food for thought. The careful tabulation and differ-

entiation of costs is praiseworthy. It would be well if a larger number of mining companies could see the wisdom of this course.

The Hosmer collieries, owned by the Canadian Pacific Railway, are now producing coal and coke. This will mean a readjustment of the fuel traffic of British Columbia. The article by General Manager Stockett is most timely.

Space will not permit enumerating the other articles that appear. We must make mention, however, of Professor H. E. T. Haultain's keen analysis of the comparative value of the mill-test and the assay. Writing in non-technical language, Professor Haultain has succeeded in setting forth this practical subject in a way that will appeal to all readers.

For our forthcoming numbers we have a long list of timely articles and reports from the pens of Canadian workers. We begin the New Year with the firm belief that our columns will prove of greater value and of higher interest than ever before.

### THE TYRRELL PRIZE.

Twelve months ago it was announced in these columns that Mr. J. B. Tyrrell, of Toronto, had offered a prize of one hundred dollars for the best collection of specimens of Ontario minerals. Professor William Nicol, of the Kingston School of Mining, and Dr. T. L. Walker, of the University of Toronto, consented to act as judges. The time appointed for submitting collections expired last month. The collection of Mr. W. P. Battersby, of the School of Mining, Kingston, Ontario, was awarded the prize.

## SOUTHEASTERN BRITISH COLUMBIA.

### A Resume of the Mining Industry for the year 1908.

J. A. OHREN.

The year 1908 has passed to the annals of history, and when the final analysis is taken of the operations of the mining industry of British Columbia for the twelve months of the year, it will be found that, despite many drawbacks, the chief industry of this Western province has taken another step forward. The first day of January, 1908 dawned on the mining industry when general affairs were unsettled throughout the country. In Southeastern British Columbia the big copper producers of the Boundary were closed down; mining was quiet in the premier lode-gold camp, Rossland; and there were grave fears that the Le Roi Company would find it advisable to stop work at its big mine there. Business was inactive throughout the Slokan, and the probability of the Dominion lead bounty ceasing in June did not tend to encourage work on the low-grade silver-lead properties of that district. Rumor had it that the Sullivan mine, in East Kootenay, would close down any day, and the Queen mine was the only property making any headway in the Sheep Creek section. But, as a perusal of the following article will show, it was not long until sunlight

broke over this dreary aspect and things moved rapidly toward a better condition.

British Columbia is the principal mineral producing province of Canada, mining over thirty per cent. of the total mineral output of the Dominion, and mining is the cardinal industry of British Columbia, contributing forty per cent. of the production in a list enumerating mining, lumbering, agriculture, fisheries and manufacturing. During the past two years the mineral production of British Columbia has amounted to over \$51,000,000. The mining and smelting industry of this province is established on a firm and substantial basis—more particularly in the principal mining districts—but this substantial form of work is fast extending to the more meritorious of the smaller camps. There is an inclination toward consolidation of interests. This is more especially the case in the low-grade sections, where plenty of money, mining and smelting operations on a large scale, and economy throughout, are necessary. The big companies, like the Granby, B. C. Copper, Consolidated Mining and Smelting, and others, have adopted a far-sighted policy

to provide for the future, and have acquired valuable mines in the different mining districts. In this way these companies secure suitable ore for proper fluxing at the smelters, meanwhile developing properties that will very likely furnish the ore supply of the future.

### **The Mining Laws.**

The mining laws of British Columbia have been, to some extent, compiled from mining laws in operation elsewhere, and so far they have been adequate to the demands made upon them. There are a few minor changes that will no doubt be made as soon as it is convenient to revise the Act. Among these changes is the suggestion of having the leases of mineral claims expire at 12 o'clock noon instead of at midnight. This would be a reasonable change, as under the present law great inconvenience is caused the mine owners. Claims are often re-staked in a wrong manner in the darkness, and the chances for evil practices are enlarged. An important decision in a contest over apex rights will soon be given by the Supreme Court of Canada in the case of *Byron S. White Co. vs. the Star Mining and Milling Co., of Sandom*. As this decision will be the first one of its kind rendered in this country, it is looked forward to with interest by mining men here. The case will have an important bearing on the future of lode mining in the Slocan.

### **Transportation.**

Railway facilities in British Columbia are improving very much every year. The V. V. & E., which will give the copper ores of the Similkameen an outlet, will soon be built to Hedley. It is expected that the work will be advanced to Princeton by the end of May, 1909, and that trains will be running into Vancouver in a year. This line has already proved of much convenience to the mines of Yale District. The Canadian Pacific Railway is now building from Spence's Bridge to Midway, via Nicola and Penticton, affording railway facilities to a region rich in coal and metal mines. The Kettle Valley line is extending its road into Franklin camp, a copper district of promise. In the Crow's Nest District the improvements have been innumerable. On the first one hundred miles of the western end of the Grand Trunk Pacific one-third of the work has already been done. Railways are needed in the Windermere and Duncan River sections. The C. P. R. has a line surveyed from Golden to Fort Steele, which will give an outlet for the products of the Windermere mining division, but no definite move has been started toward construction. An electric line was proposed for the Duncan River Valley, but so far this enterprise has not matured.

### **Markets.**

The markets for the mineral production of British Columbia are widening in an economical way as the consumption of these products in Canada increases. At the present time a great portion of these products is marketed abroad. Most of the gold is shipped to Washington Government assay offices, from whence it is sent to various parts of the United States for coinage. Much of the refined silver is disposed of in the Middle and Eastern States, although large consignments of the 999 fine silver made in British Columbia are shipped to the Orient, where it is made into money. To-day the refinery of the Consolidated Company at Trail is producing the silver used for coinage purposes at the Ottawa mint, and there is no doubt but that in a few years most of the gold and silver now mined here will be required at Ottawa for coins,

providing a more economical market than the foreign markets now afford. In fact, it is understood here that the entire gold output of British Columbia will be coined at Ottawa before another year has elapsed.

Copper matte and blister copper are sold in the United States. The lead pipe, bluestone, antimony, etc., produced here are to a great extent now disposed of in Canadian markets, which are yearly consuming greater quantities. Most of the zinc produced is shipped to Antwerp, small quantities going to the United States. The producers of lead and zinc in the United States are adverse to the admission of Canadian or Mexican lead or zinc to that country, and at this writing there is a strong sentiment against the reduction of the tariff barrier now existing.

### **Labor Conditions.**

Labor conditions are, at present, very good in British Columbia. There is a plentiful class of labor for mining work requiring skill, and the supply is at present adequate to the demand. Of unskilled labor there is, perhaps, a small surplus. Miners here are now paid \$3.50 per day for eight hours' work, shovellers \$3, and common mine labor \$2.75. Machinists, etc., range from \$4 down. The scale in force is the normal scale adopted by the Arbitration Board at Nelson in the spring of 1907. There promised to be a little friction in the Boundary last spring, when the mines first started up, some of the miners wishing to go on strike for the abnormally high wage scale that prevailed prior to the general shutdown, but a majority of the men, satisfied to get back to work at the normal scale and recognizing that conditions did not warrant a higher wage, stayed at work, and the agitators had to reconcile themselves to the situation. There was some discontent shown at wages coming down in many of the Slocan sections, but this did not amount to anything. The B. C. Copper Co., when resuming work in the spring, found skilled miners of the better class scarce, many of these men having gone to the United States, but in due time they were able to fill their ranks.

At the present time labor conditions here are all that could be asked for, and employer and employed are on the best of terms. This applies to both the coal and metal mines.

### **Geological Survey.**

The work of the Canadian Geological Survey is very much appreciated in the mining districts here in which this worthy organization has been working. The work in Rossland, Phoenix, Greenwood, Hedley and the Slocan is proving invaluable to the mining interests of those districts. The work planned in the Tulameen section should disclose some interesting information. Franklin camp, on the north fork of the Kettle River, and the Ymir-Sheep Creek districts should prove worthy of notice by this department in the future.

### **The Boundary.**

Some encouragement was lent the dark outlook at the beginning of the year by a slight rise in the price of silver and copper over the figures that prevailed during the last few months of 1907, and the work done by the Granby Consolidated M. S. & P. C. at its Phoenix mines. About one-half of the regular force was working, but the shipments were augmented week after week, so that in a very short time this company was breaking all former records of ore shipments from this district. No doubt, partly encouraged by the work of the Granby Co., the management of the B. C. Copper

Co. ordered work resumed at the Mother Lode and Oro Denoro mines, and ore shipments were begun in May. The smelter, after undergoing important improvements, was blown in, and the work has progressed satisfactorily up to the present day. The economical practice of mining and smelting in the Boundary, coupled with the heavy fixed charges of these big companies, made it a more profitable operation for the large copper producers to mine, smelt, and sell their products on a low market than to remain idle. This proving to be the case with the two principal mining concerns of the district, in June the Dominion Copper Co. resumed mining, and later on blew in the large furnaces at the Boundary Falls smelter. Increased shipments by the Consolidated M. & S. Co. of Canada from its Centre Star group at Rossland and heavy shipments from the Slocan-Kootenay made it necessary that the company have Snowshoe ore for fluxing purposes, and accordingly that mine was opened up in August, and shipments were begun to Trail smelter in September. Just now the surplus production of the Snowshoe is being sent to the Greenwood smelter of the B. C. Copper Co. The Consolidated Co. is actively executing development on its Phoenix Amalgamated holdings. This put all of the big Boundary producers on the active list during the year, where they have remained, with the exception of the Dominion Copper Company.

Southeastern British Columbia is dependent upon the Crow's Nest coal fields for its main supply of coke and coal, and in August a devastating forest fire sweeping over that section and doing \$200,000 damage to the coal and coke producing industry, for a time caused the Granby and Dominion Copper Companies to suffer a coke shortage. This shortage indirectly resulted in the Dominion Copper Co. ceasing operation, but the Granby Company easily weathered the situation by "banking" several furnaces at the smelter, and with the aid of its heavy emergency coke supply. The B. C. Copper Co. was not affected, as it received its supply of fuel from Coleman, Alberta. Most of the year a car shortage has been felt in the Crow's Nest coal mining district for the hauling of fuel, and at the time when the crops were moving East this situation was critical, but did not reach an acute stage. Even now, as the year draws to a close the car situation is not all that could be desired.

The Dominion Copper Co. did not make much headway during the year. While it was expected that the last partial reorganization of this company had placed it on a good financial basis, this has not proved to be the case. The company has been tottering along at a disadvantage financially, and the fuel shortage subsequent to the Fernie fire was sufficient to hurl its structure to the ground and carry its affairs into the courts. It has been asserted that this company has wasted money. Mining men here are slow to give this statement credence. It is a fact that considerable money has been spent in an effort to make the operations of the concern pay, but it takes a large sum of money and modern methods to make mining pay in the low-grade districts, and only those who know all the facts can tell where the faint line occurs that separates an unsuccessful, but proper, effort toward the economical from wasteful operation in this district.

The Granby Company during the past year has spent over \$200,000 in improvements and changes. This company has erected new buildings, bought a new and larger converter plant, blowing engines, compres-

sors, hoists, locomotives, and so forth. The B. C. Copper Co. has installed new ore-crushing, air-compressing and smelter machinery while at the Snowshoe-War Eagle holdings of the Consolidated many changes have been made in the power plant.

### Rossland.

In the early part of the year, when those of a pessimistic mood were predicting a close-down for the Le Roi, Mr. W. A. Carlyle made a thorough examination of the mine, and mapped out a plan of work which has been followed during the year with good results. While shipments from the Le Roi this year will fall behind the tonnage sent out in 1907, the class of ore sent to the smelter has proved to be of a higher grade, the consequence of which has been a good profit on each month's operations, the climax of these earnings being reached in October, when the net profits on the company's operation for that month were in the neighborhood of \$50,000. Mining operations on the Consolidated claims, the Centre Star, War Eagle, Iron Mask, Idaho, Enterprise, etc., have given good results, and much progress was made during the year. The different lodes being mined and developed on these claims are resulting in all that could be desired, and the ore shipments from this group will exceed the output of the Centre Star group during last year by over 50,000 tons, and it is needless to say that the profits will be proportionally increased. The operations of the company in this camp have been resulting in a profit of over \$35,000 per month, it is stated; of course, the exact figures will not be known until the year's work has been wound up. Much new ore has been opened up in the Le Roi 2 ground and the company has paid six shillings in dividends this year, four shillings of which was paid from the net earnings of the mine during 1908, and it is almost safe to say the shareholders will receive another dividend from the earnings of the past year. This company, working on a small but economical scale, in a camp where mining is fraught with many difficulties, is an example of businesslike mining. It is true the ore they find in the Josie lode carries twice as much gold and copper as any found in the Le Roi or Centre Star, but the veins are narrow, and good management is necessary to make the company pay dividends.

Nearly every one of the small claims and prospects in the camp that have a mineralized ledge in sight has been leased and worked during the past year. The miners who were able to make this form of work pay, however, were few. The lessees of the Evening Star made several thousand dollars on their venture, and the men working the Bluebird made money; but it has been very much a matter of nip-and-tuck with the others, and a couple have quit work losers. The lessee in this camp has to put a good sum of money into the ground before he can obtain results, on account of the low grade of the ore. The White Bear, Jumbo, and other properties have not been operated this season, but the officers of both companies state that money will soon be available for work. The development of the Giant-California, behind which are Granby interests, has not given the results expected, the long cross-cut failing to strike the desired continuation of the known ore shoots. Diamond drilling is now being done in an effort to locate this ore.

### Nelson District.

The extension of the Dominion lead bounty relieved the anxiety that was felt by the low-grade lead-silver

miners in the early part of the year, and as a result of this extension work has been begun on properties that would have remained idle for some time to come, and mining has been continued on mines that would otherwise have shut down. This bounty has been an important factor in the progress of mining in this district to the active stage that exists to-day.

The Silver King mine has been operated part of the year with good results on the upper levels, the unwatering of the lower portion of the mine is now going on, and the next twelve months will no doubt see some important developments at this property. In the Sheep Creek section the Queen and Nugget mines have come into prominence by their big earnings and gold bricks, and indications from the Ymir mine are more hopeful than they have been for years. The Arlington, Second Relief and other mines throughout this southern district are doing well, and new interest is shown by the owners of the smaller prospects.

Partly owing to litigation, the production of some of the Sandon mines has been restricted; but there is hope of this matter soon being settled, and with the strikes recently made on the Reco, Rambler-Cariboo, Eureka, and others, it is expected that Sandon will once more be as busy as in days gone by.

Over \$250,000 has been expended on the Blue Bell, and everything is now in line for profitable mining and milling of the immense quantities of low-grade lead-zinc ore on this group. The production of the White-water in zinc concentrate and ore has been steady, and the year's work will show good results. The output of the St. Eugene for the past twelve months will exceed the ore shipped in 1907 by about 2,000 tons. It is said that there is now a better lot of ore ready for stoping in the upper levels of the St. Eugene than there has been for years. The Sullivan mine and smelter shut down early in the year, due to financial difficulties and a change in the character of the ore, making it harder to treat. A movement is afoot to adjust Sullivan affairs. It is estimated there are 150,000 tons of ore blocked out in this mine.

### In Conclusion.

One need not be an expert in mining affairs to be able to discern the march forward that the mining industry in British Columbia has taken during the past year. The output of ore from the Boundary will exceed that of any previous year by over 270,000 tons; the Rossland output will exceed 1906 by 15,000, and 1907 by 10,000 tons, despite the falling off in Le Roi shipments, while Slocan-Kootenay shipments show a more healthy condition than last year, although the actual list shows a smaller tonnage treated, the shrinkage being caused by the shut-down of the Sullivan, La Plata, and other heavy producers of low-grade ore; but the advance among the smaller mines—the coming profit-payers of this district—is noticeably greater.

The prospects for the year now before the district are most propitious. The mines are prepared for a year of heavy production. The big political and financial questions that affect the country at large are settling nicely; Eastern capital is flowing easily westward, this being more noticeable than before the troublous times of a year or so ago, the actual effect being seen in the purchase by Eastern men of the Queen, on Sheep Creek, and the Iron Mask mine, at Kamloops. There is a tendency to give the miners their supplies at a more reasonable price than has prevailed in the last year or two. Labor also has been brought to see that inflated wages do not bring any great benefit, indirectly working a boomerang effect on themselves, and, best of all, the metal market is becoming firm and prices are rising to a normal figure based on a healthy demand. There has been a reconciliation. All have stopped a moment and looked back at their error, have recognized the worthlessness of frothy inflation, and are desirous of working forward during the year 1909 on a sound, wholesome basis. If this lesson is kept well in mind during the next twelve months, it is safe to predict that 1909 will be a more prosperous year by far than 1908, as the material is proved, and all that is necessary is the proper application of energy to make another pace forward.

## C. P. R. COLLIERIES IN THE WEST.

### The Bankhead and the Hosmer Collieries—A Review.

By General Manager Lewis Stockett.

The collieries of the **Bankhead Mines, Limited**, are situated on the main line of the Canadian Pacific Railway Co., at Bankhead, Alberta.

During the year 1908 the mine has been further developed by the driving of an incline on No. 6 seam to open an upper level. This incline, on a pitch of 32°, has been equipped with a cage and counter-balance, and operated by a pair of 10x12 hoists. From this incline, cross-cuts have been driven to the Nos. 5 and 4 seams. A slope has been sunk on the No. 4 seam, pitching 35°, on which the cars will be hoisted direct on the track, by a pair of 12x15 engines. To prevent the coal spilling off the cars on this pitch, covers will be placed on them, and automatically removed at the head and foot of the slope.

An additional unit of machinery has been put in the breaker, enabling a larger tonnage to be handled, and the coal more thoroughly prepared.

In the briquette plant, steam coils have been substituted for the melting of the coal tar pitch, instead of by direct fire.

The production of coal for the year 1908 will be about 250,000 tons, and of briquettes about 36,500 tons.

**The Hosmer Mines, Limited.**—This is a new colliery, located on the Crow's Nest Branch of the Canadian Pacific Railway, at Hosmer, B.C., and did not commence shipments until December 18th, 1908. The production of both coal and coke for the year 1908 consequently will be small. A detailed description of the plant is as follows:

The property consists of six sections of coal lands, and two sections of surface, on which the town of Hosmer, and improvements connected with the plant are located.

The seams, of which there are thirteen in number,

varying from 4' to 30', are being opened by a tunnel, driven at right angles to the measures, and starting at a point about 600' higher than the railroad track at Hosmer Station. Two tunnels are being driven parallel with one another, the larger tunnel consisting of three compartments, two of which will be used for haulage purposes, and the third as a travelling and pipe way, and the parallel tunnel, consisting of one compartment, will be used as a return air course, in connection with the ventilation of the mine. The tunnel is in at the present time 3,700', and has cut eight of the seams, and ultimately will have to be driven in 5,000 to cut the thirteen seams. These seams vary in dip from sixty-five degrees to thirty-five degrees. The tunnel was started in the Fernie shales underlying the coal measures, reaching them at a distance of 847', and the first seams cut are, therefore, the lower ones of the series. The coal is bituminous, decidedly rich in hydro-carbon, and, therefore, an excellent coking coal as well as a steam coal.

The ventilation of the mine will be produced by a 20' x 9' Walker Fan, running as an exhaust fan, but so fixed that, if necessary, it can be run as a blow fan. This fan will be driven by a pair of 30" x 16" engines, connected up to the fan by a rope drive, the steam for which is supplied by three 80 H.P. boilers. The fan is of steel and concrete construction, and the engine-house of brick. The other buildings at the mouth of the mine will be a concrete lamp house and time-keeper's office, locomotive house for the compressed air locomotives, and wash house, with baths and lockers for the use of the miners.

The coal will be lowered to the level of the tippie by a steam actuated, double track incline, each track being an independent incline. The mine cars, holding two tons of coal each, will be lowered in trips of twenty cars, and the empty cars hoisted in convenient numbers. The haulage engines are a pair of 28" x 48" first motion engines, with 8' drums, fitted with clutches and brakes, which, with the reversing gear and throttle, are all handled by steam, working through cataraet cylinders.

From the foot of the incline, the cars will be hauled to the tippie, by a compressed air locomotive, and dumped into the same over a cross-over dump, passing over shaking screens to remove the slack for the coke ovens, and over picking bands, for the purpose of removing the refuse from the larger size coal. Storage bins are provided to hold 2,600 tons of coal, 200 tons of rock, and 3,000 tons of slack for the coke ovens. The rock in the rock bin is drawn out into iron self-dumping cars, and hauled to the refuse dump by a compressed air locomotive. The coal in the coal bins is loaded into box cars by a box car loader, and the open cars from chutes. The slack from the slack bins is loaded into seven-ton larries, and hauled by a compressed air locomotive over the coke ovens.

There are 240 Bee Hive Coke ovens, twelve feet in diameter, and seven feet high, which will give an output of 300 tons per day. Belgian ovens, with by-product recovery, and distilling plant, are in contemplation for the next ovens required.

The power house building, of re-enforced concrete, with steel floor joists, and roof trusses, which roof trusses are covered with corrugated iron, contains two low pressure compressors, and two high pressure compressors, the former to furnish air at 100 lbs., for the rock drills, inside hoisting engines, and various other purposes around the plant; the latter to furnish

air at 1,000 lbs., for the five compressed air locomotives. The seventy-five K.W., alternating current generators, for the purpose of lighting the town and plant, are driven by two 125 H.P. engines. All of these engines are fitted with cut-off valves, the purpose being to carry steam, at 120 lbs. pressure, cut off early, and use the steam expansively. The exhaust steam from all of these engines is connected into two 20" pipe lines, one known as the atmosphere line, and the other as the heater line. By means of valves, the steam from any or all the engines can be turned into either of these lines. When turned into the heater line, the steam passes through a 1,500 H.P. Hoppe's Exhaust Steam Heater, heating the boiler feed water to 200° F. A ten-ton travelling crane has been installed for the convenient handling of the machinery.

A boiler house, also of re-enforced concrete, with steel trussed roof, covered with corrugated iron, and cement floor, contains four 250 H.P., Babcock & Wilcox boilers, with chain grate stokers, and appliances for the convenient handling of coal and ashes.

The town on the company's property at the present time consists of a general office, mess house, three officers residences, several foremen's houses, a large boarding house, and sixty miners houses, and hospital, all neatly painted and supplied with water and electric light. Quite a large and progressive town has been built across the railroad tracks, on property not owned by the company, and where are located the stores, hotels, etc., necessary for the maintenance of a miners camp.

The Elk River property is situated 45 miles north of Michel, B.C. During the past year continuous explanatory work and prospecting work has been done, with a view of opening up two or three large mines, when a branch of the Canadian Pacific Railway has been built from Michel to the property.

## MINING IN QUEBEC DURING 1908.

(Special Correspondence.)

Mining has been relatively quiet in this Province during the year with, nevertheless, a notable progress.

Asbestos mining and milling is still the leading industry, and quite an excitement has been prevailing in some districts which had not attracted much attention before, especially at East Broughton. Three mills have been in operation there, and two more are under construction, viz., one owned by the Frontenac Asbestos Company and the other one by the Boston Asbestos Company. This last one began to run in October with good results. The mill is well equipped and has been treating successfully some good fibrous material recently discovered.

Some prospecting has also been done in the district of Bolton, and we understand that mining operations and building of mills will soon begin there.

Besides there are several other companies in organization in different places of the asbestos district.

The mines at Thetford and Black Lake and Danville have been in operation as usual and now all use electricity as power.

The Black Lake mining and concentrating of chrome ore is going on as usual. Two mills representing 50 stamps have been in operation during the year.

Near Sherbrooke only one copper mine has been in operation at Capelton, and another one, being worked successfully in a neighboring locality. Several pros-

pects have been made in the same vicinity, in Ditton, and at Lake Megantic for gold, and very likely some development work will follow next summer.

In the Ottawa district, the mica industry has come to a standstill for some time on account of the general depression of business. The graphite mines at Buckingham show some activity and we expect to see the mills erected there to become producers of prepared graphite.

Near Calumet, a magnesite mine was open, which we expect will be soon developed. In the vicinity of

Montreal two very important Portland cement factories have started operations.

In the northern country, no important discovery has been made and prospectors are awaiting the building of a railroad for developing Chibogomo district. During the season two explorations were made by the department to the north; one to Chibogomo, which has confirmed the discoveries already made there, and the other one to the north of Outardes River, on the Labrador coast, to study the possibilities of that district.

## THE CROWN RESERVE MINING COMPANY, LIMITED.

About one year ago all that was evident of the Crown Reserve mine, apart from the enthusiasm of Mr. Samuel Cohen, was a body of water, twenty-three acres in extent, near the centre of which was a small island, where now stands the mine office. At that time the only tangible evidence of silver was a small diamond drill core.

The work of lowering the lake was begun last October. By February 1st, 1908, the water level was lowered eight feet by means of the canal from Kerr Lake to Glen Lake. The change exposed a peninsula of land about three acres in extent. The peninsula could hardly be termed "terra firma." With the exception of the point, the exposed area was composed of marl, in some places fifteen feet deep, and not unlike quicksand. Contrary to expectations, the rock did not slope out gradually from the shore, but dropped abruptly, leaving a bank of marl.

With a dozen men and no plant, Mr. Cohen commenced to dispose of the marl. He first allowed it to freeze, and then worked off fifteen-foot slices. Thus an open trench was formed, three sides of which were frozen marl and the fourth the shore of the lake. The trench was deepened until bedrock was reached and the vein exposed. A little tar-papered shack, in which the men slept, was the only building then on the property.

Money was now an absolute necessity. The vein as exposed on the surface was only six inches wide, and showed richly for but a length of ten feet. It was determined to take out enough ore to provide the small amount of machinery necessary for further work. Mr. Cohen, therefore, gouged out from the surface  $6\frac{1}{2}$  tons of ore and shipped it by express to the American Smelting & Refining Company. The ore, consisting practically of silver and calcite, was cupelled. The gross value of the silver extracted was \$13,000. With the returns from this first shipment a 30-h.p. boiler and a small hoist were purchased. An open cut, 30 feet long, was now started. The next carload of ore extracted was probably the richest shipment of silver ore ever shipped. It averaged 9,000 ounces to the ton, and there were over five tons of nuggets bagged from the car.

The open cut was continued until a depth of 50 feet was reached. At the same time Mr. Cohen commenced sinking the main shaft at a point 200 feet east of the open cut, where a small outcrop of rock occurred above the level of the lake. After sinking to a depth of 100 feet, a cross-cut was driven north to catch the main vein. This was encountered 25 feet from the shaft. Up to this time about \$350,000 worth of ore had been

taken from the open cut. Open cast work was then discontinued, but a winze was sunk from the open cut to develop the vein. The winze is now down 135 feet in rich ore.

PLAN & PROFILE  
THE CROWN RESERVE MINE  
Scale 1" = 120'

As the accompanying plan shows, the vein has been drifted on from the new shaft about 100 feet to the east line of the property, and west to within 30 feet of the open cut. Assuming the vein to be continuous

through this 30 feet, a continuous ore shoot 300 feet in length is indicated. In width the vein measures from 6 inches to 33 inches. An average of 12 inches may be considered as under the actual truth. As stated above, the first car shipped averaged 9,000 ounces. This, of course, was exceptionally rich. The high-grade average now is about 5,000 ounces. There is also a mineralized zone extending four feet on either side of the vein. After the high-grade ore is picked out of the muck, the half-inch screenings from the whole face of the drift, seven feet wide, averages 250 ounces to the ton.

But it gives one a startling conception of the richness of Crown Reserve to be informed that at one time responsible visitors could see a vein 33 inches wide which averaged 10,000 ounces to the ton. One piece of ore weighing 435 pounds was sold to the Geological Survey at Ottawa. The Survey willingly paid for this specimen at the rate of \$5 per pound. Last summer, when the European guests of the Canadian Mining Institution visited the Crown Reserve, there was a pile of high-grade ore in the little ore-house measuring 8 feet by 10 feet by 10 feet. This was valued at \$200,000.

With the exception of the ore from the open cut, all ore shipped has been won from development. The stopes are still intact. The cross-cut to the north has intersected eight silver-bearing veins, ranging from  $\frac{1}{2}$  to 3 inches in width, and showing in some cases high silver contents. Cross-cutting is in progress eastward to cut the 7-inch vein of the Kerr Lake property, which, it will be remembered, was discovered by Mr. Cohen. The Kerr Lake people are drifting on this vein not far from the Crown Reserve line. The Crown Reserve cross-cut will run down the lake, and, at 500-foot intervals, other cross-cuts will be continued to the shore line for air.

Around the main shaft is a substantial concrete collar, which comes above high water mark. All of the buildings also, including the shaft-house, ore-house, and power-house, in which there is any machinery, are on solid concrete foundations to bedrock.

The bunk-house and dining-room accommodate 100 men. The shaft-house is 10 feet high. The power-house is equipped with one 100 h.p. boiler, one 30 h.p. boiler, a six-drill Sullivan compressor, a dynamo, hoist, pumps, etc. There are also blacksmith and machine shops. In the latter is a machine lathe. The assaying and drafting building and the ore-house, which is practically a little mill, must also be mentioned. In this ore-house all of the high-grade ore is put through a small Moussette mill, which extracts the nuggets. The nuggets are melted into bars in an oil furnace. The pulp from the Moussette mill is high-grade ore. It contains about 4,000 ounces of silver to the ton. Everything except the high-grade ore is put through an Austin gyratory crusher, which crushes the material to pass a two-inch ring. The crushed material then passes to a trommel, which separates the  $\frac{1}{2}$ -inch stuff containing 250 ounces per ton. From the trommel the 1-inch and 2-inch goes over a picking belt, when the high-grade ore is picked out by hand. By this simple process practically all of the valuable ore is saved. Only the silver that is tied up in the country rock is lost.

An extraction of 95 per cent. of the total silver that goes into the ore-house is counted upon. When the dump is of sufficient size to warrant the installation of a mill, either the ore-house can be more completely equipped or the dump can be sold to one of the custom mills. At present the simple operations outlined above are found to be cheap and effective.

In conclusion, in February, 1908, the first shipment of 61½ tons was made. In April regular shipments were begun. Including the ore on hand in December, 1908, there has been shipped a total of 540 tons. Of this 140 tons were screenings averaging 250 ounces to the ton, and the balance, 400 tons, was high-grade ore. Thus the value of ore shipped during little more than nine months of initial development is about \$850,000. Until August all of the work was done by hand. Since then only three machine drills have been running.

This is indeed a record as interesting as it is remarkable.

## THE MINING OPERATIONS OF THE DOMINION COAL COMPANY.

### Article IV. THE HUB SEAM.

By F. W. Gray.

The Hub Seam is the highest seam that has been preserved in the land area of the Glace Bay Basin. A glance at a map of the Basin will illustrate the thought that gave the seam its unusual and appropriate name. The visible crop circumscribes a limited area of a semi-circular shape measuring roughly one mile between the intersections of the seam with the face of the cliff at the shore, and a little over half a mile at the extreme radius inland, taking Table Head as a centre point. The shaft of the Hub Colliery forms therefore the approximate centre of a series of concentric arcs described by the outcrops of the coal seams, and the general appearance of the geological map suggests a wheel with its central "hub."

In Mr. Hugh Fletcher's table of equivalency the Hub is regarded as the equivalent of the Barasois in the Lingan Tract, and it is not present in the Morien

Basin. According to this table there are two seams above the Barasois, one of which, known as the Carr Seam, is 6 ft. 5 ins. in thickness and is situated 190 feet above the Barasois. These seams may be represented in the submarine portion of the Glace Bay Basin, and there is a possibility that at some remote future date the equivalent of the Carr Seam may be reached from the submarine workings of the Hub Seam by means of an inclined cross-measure drift. Only a very narrow strip of this seam can, however, have been preserved at a sufficient depth below the sea floor to enable it to be worked, and the fact of its possible existence is mentioned merely as interesting, but not as a serious factor.

The average thickness of the Hub Seam is 9 ft. 6 ins. It is characterized by a more or less undulating pavement, and local variations in the character of the seam have been met with. It yields an excellent house or

steam coal, with a lustrous appearance and a decidedly cubical fracture. It is to be regretted that Nature has not left us a greater area of such a valuable coal seam as the Hub. This is a comparative statement, having in mind the much greater areas in the lower and less profitable seams. Dr. Edwin Gilpin estimated a total accessible area in the Hub Seam equal to a yield of 35,000,000 tons, but there is every reason to believe that undersea workings can be prosecuted at a much greater distance from the shore-line than the limit used by Dr. Gilpin in his calculations.

Considering the seams as a whole the amount of coal which at a future date may be won from the submarine areas of the Glace Bay Basin will depend to a large extent on the extent of the dislocation which attends the seaward course of the Bridgeport or East Bay Anticline, and the extent of the submarine denudation along the crest of the fold. This as yet is a matter of conjecture and hypothesis only, but there are

from what has been found to occur in the land area, the miner of the future may come across local troubles and variations in the character of the coal seams. Writing in 1872, Dr. Edwin Gilpin made the following statement: "The former extent of this coalfield to the eastward is now a question beyond the reach of solution, and the conviction is forced upon the mind of even the most casual observer that it is but a remnant of the measures deposited at the coal-producing period of the carboniferous era; that the rim only is left of an immense district, now lost under the Atlantic."

As one would expect from its exposed position, the Hub Seam was one of the first to be worked in the Glace Bay Basin. Much of the early history of the coal trade of Cape Breton centres around that portion of the shores of Little Glace Bay which is included between the crops of the Hub Seam. Not far from the Hub Colliery is Burnt Head, the scene of exciting passages in the long-contested struggle between the French and the English

TABLE HEAD—LITTLE GLACE BAY.

On the left hand of the view the roof of the Hub Seam dips under the water. A small seam of cannel coal can be seen along the side of the headland. The photograph was taken four hours before high water.

indications which favour the theory that the continuity of the lower seams is not altogether interrupted by the anticline in the whole of the accessible submarine area. So far as the Hub Seam is concerned, however, its submarine outcrop lies at least three miles inside the anticlinal line.

On the southern boundary of the basin the coal seams crop out with great regularity from Glace Bay to Cape Percy, where they pass into the ocean. The projection of the line of outcrop of the Lorrway Seam as shown on the Geological Survey corresponds with the seam that shows itself in Flint Island—an outlier of Cape Percy, separated by a distance of two and a half miles. A line drawn on approximately the full dip of the seams through Flint Island will pass the axis of the Basin at a point seven miles to sea off the shores of Table Head. One might assume, therefore, that no marked interruption in the continuity or dip of the seams occurs within the accessible area of the coalfield; although, reasoning

for the possession of Canada. During the English occupation from 1745 to 1749 the garrison at Louisburg was supplied with coal taken from the entrance to the Little Bras d'Or and the vicinity of Burnt Head. Being apprehensive of attacks from Indians, who were friendly to the French, the English erected a blockhouse on Burnt Head. Remains of the ditch are still visible, although the actual site has long since been swallowed by the sea. Mr. Richard Brown quotes from a history written in 1760 by M. Pinchon, the Secretary of the French Governor of Louisburg, as follows: "The English had a coal pit at Burnt Head defended by a fort of considerable strength, where with fifty men they successfully repulsed the attacks of the savages and kept possession of the fort." Mr. Brown adds that the pit took fire in 1752, when the fort also was entirely consumed. Traces of this fire may still be seen along the crop of the seam for a distance of nearly one mile. The surrounding measures, mostly soft shales, have been baked by the

heat to every gradation of colour, and a very pretty gravel may be quarried out of the cliff. Pebbles are to be found on the beach, so rounded by the sea's action as to show the different laminations passing from green to red in all its variations. In the cliff itself are to be found perfectly preserved fossil impressions, while at other points the cliff has been fused into a mass resembling a furnace slag-dump.

The Hub Colliery has seen numerous vicissitudes in its life of fifty years. After the cancellation of the monopoly of the General Mining Association, Mr. Archbold mined the Hub Seam by means of shore levels from 1858 to 1861. In the latter year the Glace Bay Mining Company acquired the mining rights from Mr. Archbold and sunk two shafts, 130 feet deep, down to the Hub

acquired the property they pumped out the workings, and between 1895 and 1899 they extracted about 350,000 tons. In 1899 the mine was again abandoned, and was once more pumped out in 1903, when the curtailment of the company's output by the Dominion No. 1 fire made it necessary to open up some additional supply. The mine was largely extended and the deeps were driven a long distance into the submarine field, when operations were again interrupted by a disastrous fire which occurred on the 14th of December, 1906. It was found necessary to flood the mine, and hoisting operations did not recommence until November, 1907.

Old residents invariably refer to the Hub Colliery as the "Roost." In the early days of mining there, a long ridge of sandstone ran out into the sea near Burnt

Crop of Hub Seam in base of cliff near Table Head. Portion in shadow on left hand is where sea was first admitted into workings after the fire. The cavity is now silted up

Seam. One of the shafts was used for hoisting coal, and is still used for that purpose by the present owners. The other shaft was used for ventilating purposes, and was originally intended for a water shaft also, but was never so used, as the workings were drained by an adit driven out to the shore. Practically the whole of the land area was extracted, and in many places the measures were cracked up to the surface, admitting the outer air. The Glace Bay Mining Company erected a surface equipment and constructed a railway one mile in length to Glace Bay Harbour, which they enlarged and used as a shipping port, as described previously. They continued to work the Hub Seam until they had opened up the Harbour Seam at the Stirling shafts in 1876, after which they abandoned the Hub Mine and allowed it to fill with water. When the Dominion Coal Company

Head, and was a favorite resting place for the common cormorant or Shag. It was generally known as the Shag Roost. One of the shore levels worked by Mr. Archbold commenced on the Shag Roost, and in course of time the mine came to be known by the shortened appellation of "the Roost."

The fire of December 14th, 1906, is a matter of history and may be referred to more fully. The fire appears to have commenced in a pumphouse in the pit bottom in the afternoon of the 14th of December, and its origin has never been definitely ascertained. The smoke followed the return air up the hoisting shaft and rendered it difficult to use the shaft or approach the seat of the fire. It was decided to reverse the fan to clear the smoke and get access to the flames. This operation took a long time, owing to the fact that all

the underground connections and doors were frozen by the intake air. All attempts to extinguish the fire failed. The heat was communicated to the fan, which failed about 9 o'clock in the evening. All the men were withdrawn, and it was decided to seal the hoisting shaft. While the work was in progress, however, the air suddenly reversed itself and a gush of flame came up the hoisting shaft, set fire to the bankhead and practically

in. A shaft was then sunk from the surface to the bottom of the coal seam down the face of the cliff. This work was commenced on the 29th of December and continued without intermission, with four shifts per day, until the 9th of January, on which date the pavement was reached. A level was driven to a point below the sea-level at high tide, and a communication was made with the sea, which resulted in letting into the mine a

The Hub Colliery (Dominion No. 7) before the fire of December 14, 1906.

the whole of the surface erections were destroyed in half an hour. Finally it was decided to flood the mine, and all the available surface streams were turned into the shaft. On the 16th an old level at the shore, close by the adit previously referred to, was opened up, and the water of the Atlantic at high tide flowed into the mine. The volume of water flowing in was too small, however, to effectively and quickly flood the mine, as the seat of the fire was at the shaft bottom, and the whole of the deep workings required to be flooded before the water would come in contact with the fire. The inflow of

great volume of water. On the 28th of January the water had risen to sea-level and covered the seat of the fire. The hoisting shaft was unsealed on the 2nd of February, and the opening into the ocean was closed by a concrete dam. Pumping commenced on the 14th of February, and continued until the 1st of November, when the face of the deeps was reported dry. The regular hoisting of coal began in December, 1907, about a year from the date of the fire.

The work of unwatering the mine was greatly hindered by the corrosive nature of the mine water. The

The Hub Colliery after the fire of December 14, 1906.

water was also considerably hindered by the silting up of the opening every tide by gravel washed in from the sea. It was found impossible to clear away the gravel because of the enormous amount of carbon dioxide gas that the opening emitted. In addition to this the opening was situated under a dangerous overhang of cliff weighted by icicles which made the place unsafe to work

upper part of the workings was filled with slack, which in the old days was an unsaleable bye-product and was left in the mine. As the water drained out of these old workings and percolated through the slack it acquired a particularly virulent character and worked havoc with the pumps and necessitated constant repairs. Another peculiar feature of the unwatering operations was

a frozen saline deposit which had formed to a considerable thickness along the rim of the water as it receded. This substance resembled a coarse sea-salt, and it was found to have absorbed appreciable quantities of carbonic oxide gas, which diffused into the atmosphere as the deposit was disturbed by the shovel in the work of clearing. The workmen suffered a little from headache and the nausea that is associated with carbonic oxide poisoning.

Since the fire the Hub Colliery has been entirely remodelled both above and below ground, and it is practically a new mine. At the present time the output is

B. & W. boilers, rated at 500 h.p., and room has been left for an additional battery when it is required. A small brick extension on the back of the house contains the feed water pumps and a Webster feed water heater. In this extension is also housed the fire-pump, which is a Knowles duplex pump 14 in. by 7 $\frac{1}{4}$  in. by 12 in. The fire discharge lines consist of a 6-inch main with 4-inch and 2 $\frac{1}{2}$ -inch connections. Hydrants are placed in the bankhead, the rescreening house, and at numerous points around the colliery. The circulating water and the water reserve for fire protection purposes is contained in a circular reservoir holding 400,000 gallons, situated imme-

No. 7 HEADFRAME.

800 tons per day, but in the summer of 1909 it is expected to reach 1,200 tons daily.

The surface power plant is not a large one, as a large part of the motive power used at this colliery is obtained from the Central Electric Plant.

Before the fire the mine had 828 h.p., of Babcock & Wilcox boilers, housed in a wooden building. This was completely destroyed by the fire. The boilers were repaired, not being greatly damaged by the fire, and a new frame building was erected, 60 ft. long by 40 ft. wide.

A new brick boilerhouse, 65 ft. 8 in. by 51 ft. 8 in., with cast steel roof trusses and corrugated iron roof, has been erected since the fire. It contains two batteries of

diately at the back of the boilerhouse. The new steel stack of the boilers recently installed is 7 ft. 9 in. diameter inside the shell, 100 ft. high, cast-iron base plate, lined with 4-inch fire brick for 35 ft. from the base and with red brick for the remainder of the distance, secured with two sets of guys.

The coal-hoisting engine is a horizontal, double engine, built by the Jenckes Company, cylinders 24 in. by 42 in., with Corliss valve-gear. The drum is 8 ft. diameter by 6 ft. on the face. The hoisting rope is 1 $\frac{3}{8}$  in. diameter, passing over 12 ft. pulleys. This engine went through the fire, but was successfully repaired.

The man-hoisting engine is a new one, replacing the

one in use before the fire, which had outlived its usefulness. It was built by Matheson, New Glasgow. It has cylinders 18 in. by 36 in., slide valves, drum 6 ft. 8 in. diameter by 12 ft. 6 in. The rope is  $1\frac{1}{4}$  in. diameter.

There are two Norwalk air compressors with a capacity of 2,000 cubic ft. each. Before the fire they had single steam cylinders, but they are now tandem-compound, air cylinders 19 and 30 by 30 in. stroke, steam cylinders 20 and 34 by 30 in. stroke.

The bankhead is an entirely new structure. It is built of hard pine on concrete pedestals, and is 105 ft. long by 31 ft. 6 in. wide. The head-frame is built of 10 in. by 12 in. hard pine posts, with backstays 12 inches square. The height of the centre of the pulleys is 75 ft. This head-frame, in common with those of No. 10 Colliery and the International Water Shaft, has a simple device for hoisting the winding pulleys into position. The framework is carried up 17 ft. above the centre line of pulleys, and is fitted on either side of the framework with projecting  $1\frac{1}{2}$ -inch eyebolts to which the tackle can be attached. By this provision the pulleys are easily hoisted and swung into position, and an operation which is often a cause of annoyance is thereby simplified.

The coal is hoisted on the ordinary dumping cage, which discharges into a weigh-tank. The latter empties itself onto feeder belts, which travel at the rate of 13 ft. per minute, and empty their contents onto a triple battery of shaking screens operated by eccentrics from shafting. From the screens the coal passes on to two picking belts, 40 ft. long and 5 ft. wide, which feed a loading belt 35 ft. long and 35 ft. 6 in. wide. The arrangements are such that any coal for the boilers can be dropped out of the weigh-tanks into tubs and run along a special trestle to the boiler room. The whole of the bankhead machinery is operated by electric power. Each side of the screening machinery is driven by a separate motor of 15 h.p. The loading belt is driven by a  $7\frac{1}{2}$  h.p. motor. All the machinery is operated by separate friction clutches.

The screening arrangements are practically a duplicate of those at the Reserved Colliery, and were built by Plowright Bros., of Chesterfield, England. The machinery had been installed shortly before the fire, and after the fire it was found to be badly twisted. It was repaired by the Brown Machine Co., and put into the new bankhead.

Other surface erections belonging to the colliery are the Wash House, Warehouse, Lamphouse, Firemen's Hall, Forge and Carpenter Shop.

The mine is ventilated by a Capell fan, 11 ft. dia. meter, by 8 ft. 6 in., running at 220 revolutions, with a capacity of 200,000 c. ft. per min., at 2 ins. W. G. The fan is enclosed in a steel and concrete casing, and is driven by a 12 in. by 15 in. Robb engine. The air shaft is circular, 9 ft. 6 in. diameter. It is 130 feet deep, the same depth as the coal shaft. A large amount of work has been done underground since the fire in building permanent brick and concrete stoppings, and improving the air courses.

The coal shaft is divided into three compartments, two for coal hoisting and one for the man's cage. It is 11 ft. 4 in. by 20 ft. 8 in. over all. A new concrete lining has been placed around the mouth, extending down the shaft for a distance of 24 feet from the surface. The coal compartments are 6 ft. 6 in. by 10 ft., and the man cage compartment is 5 ft. 2 in. by 10 ft. The after-effects of the fire necessitated repair work in the bottom. Large concrete piers and wood packs made out

of old railway ties have been placed around the shaft bottom, and the roof has been completely boarded over.

A new electrical haulage system has been put down underground since the fire. The hoist is driven by a 200 h.p. Westinghouse variable-speed induction motor, 550 volts, 288 revolutions. The engine itself was built by Matheson, of New Glasgow. It is fitted with a Hill type friction clutch. The driving sheave, or "bull-wheel," is 6 ft. 6 in. diameter. The engine house is brick-lined, with concrete floor and foundations, and the roof is supported by 24-inch I beams, with about 20 ft. span. The mine cars used are of two tons capacity. The track gauge is 2 ft. 2 in. The haulage rope at present used is 12,500 feet in length, of  $1\frac{1}{8}$ -inch wire rope.

Approximately below the shore-line underground is an electrically driven pump made by Hathorn Davey, of Leeds, Eng. It is a three-throw reciprocating pump, 10-inch plungers, 24 in. stroke, with a capacity of 500 gallons per minute at 175 feet head. It is driven by a 75 h.p. Westinghouse motor, constant-speed, running at 480 revolutions per minute. The pump is housed in a brick-walled chamber, with concrete floor, and roofed with steel I beams.

Further down the deeps is a McDougall turbine pump, built in Canada. It has a 5 in. discharge, three-stage impellers, and has a capacity of 550 gallons per minute against a head of 310 feet. It is driven at 1,420 revolutions per minute by a 100 h.p. Westinghouse constant-speed induction motor.

The transmission cable for the pumps passes down a borehole 163 feet deep, situated not far from the shore. The cable used is lead-covered with paper insulation. The conductors are three in number, No. 4-0. A  $\frac{3}{4}$ -inch wire rope is attached to the surface and passed down the borehole, to which the cable is attached by lashings every two feet. At the foot of the borehole the main transmission is divided, one lead going to each of the two pumps described. In the mine the cables are laid in the side of the travelling deep in wooden boxes along the pavement. The discharge of the two pumps is made through a common borehole at a point near the transmission borehole. The discharge hole is lined with 8-inch wrought iron casing, cemented in, and finished with a cast iron section at the foot of the hole. The cable borehole is also lined with 6-inch wrot. iron casing.

The transmission cable for the haulage plant is conveyed in a similar manner down a borehole near the colliery office.

The coal is undercut with the ordinary "puncher" machine, for which compressed air is used. A few small pumps are also driven by air.

Every precaution has been taken underground to protect the workings against fire. Every engine-house and pumphouse has a small chemical fire-extinguisher, and, as in the other collieries, the air lines are so arranged that they can be connected with the pump discharge at short notice. The pit bottom is plentifully supplied with extinguishers and stand-pipes.

Nothing but safety lamps are used in the mine. At the present time lamps of the Marsaut type are in use, but they are very shortly to be replaced by the A. & B. type, which is in use in the other mines. The mine is naturally a safe one, being more or less damp, and gas is not present in any large quantities.

Under normal output the mine will employ between 300 and 400 men. The horses number around thirty.

In the colliery yard is situated also the Rescreening Plant for the Central Banking Station. This erection

is 81 ft. long and 39 ft. high to the centre of the haulage pulley. The coal is filled at the Banking Station into cars and hoisted up a long inclined trestle to the screens where the slack is taken out. The haulage is effected by a Matheson engine 18 in. by 36 in., housed in a wooden building.

The work of rebuilding the Hub Colliery after the fire gave opportunity to the officials of the Dominion Coal Company for some very prompt and effective construction work. The photographs accompanying will give some idea of the completeness of the destruction and of the rapidity with which the reconstruction work went forward. The Rescreening Plant, for example, was com-

on the iron ores and the status of the iron and steel industry of Canada.

Mr. Kraynik took part in the excursion of the foreign engineer and metallurgists arranged by the Canadian Mining Institute through Canada in August and September last. His lecture was the more interesting as generally little is known across the water regarding the iron resources and the condition of the iron and steel industry in this country, and this interest was clearly evidenced by the discussion on the subject afterwards. Mr. Kraynik's paper dealt with the

(1) General condition of the iron industry in regard to the iron ores mined in Canada, the iron ores of

RESCREENING PLANT AT DOMINION No. 7.

mended and finished between the 6th of April and the 6th of May, months in which construction work is not favoured by the weather in Cape Breton. The head-frame and bankhead were also reconstructed within the space of three months.

#### LECTURE ON CANADIAN MINING INDUSTRY AT DUESSELDORF, GERMANY.

Before a large gathering of representative mining, iron, and steel men, at Duesseldorf, Rhenish Prussia, on the 6th December last, Mr. Ernest Kraynik, M.E., metallurgist, of Berlin, delivered an interesting lecture

Nova Scotia (Annapolis, Londonderry, and Newfoundland).

(2) Iron and steel metallurgy in the Dominion Iron and Steel Works, Nova Scotia Steel Co., and Londonderry Iron Works.

(3) Iron ores in Quebec and New Brunswick (Bathurst), works at Drummondville, Radnor, etc.

(4) Iron ore resources in Ontario, Animikie in comparison with Mesabi formation, the Helen mines Moose Mountain and Atikokan iron ranges.

(5) The works at Midland, Port Arthur, Sault Ste Marie, Hamilton, and Deseronto.

(6) The feature of electric smelting in Canada, the

Grondal process, the electric furnace at Welland and Niagara Falls.

(7) The mining industry and its future in British Columbia and Vancouver.

### GYPSUM.

Opportunities for developing large gypsum properties are not lacking in Canada. Gypsum, as a mine

product, will stand only a limited cost of transportation. Most of the New Brunswick and Nova Scotia quarries are on or close to tide water. Hence cost of handling is reduced to a minimum. If, however, the gypsum were reduced to the plaster of commerce and the arts at or near the quarry, the range of the market would be extended very considerably. The necessary plant is cheap. Installation of this sort would increase the value of the quarry immediately.

## LA ROSE MINES, LIMITED.

Editor's Note.—In response to our request for information, the management of La Rose Mines, Limited, readily furnished the Canadian Mining Journal with the following statement and resume:

### La Rose Consolidated Mines Company.

Production six months ending Nov. 30th, 1908.

The completion of the first six months work on the property of the La Rose Consolidated Mines Co., shows the following work accomplished up to November 30th:

|                               |                  |
|-------------------------------|------------------|
| Drifting. . . . .             | 1,957 feet.      |
| Cross-cutting. . . . .        | 555 feet.        |
| Raising and sinking . . . . . | 216 feet.        |
| Trenching. . . . .            | 8,181 feet.      |
| Open cutting . . . . .        | 99 Cubic yds.    |
| Stoping . . . . .             | 2,861 Cubic yds. |

The properties worked have been the La Rose, Princess, and the Violet; no work has been done on the Eplett, Fisher or Silver Hill claims.

On the main La Rose vein, much of the development has been done on the lower intermediate, between the first and second levels. The results have been much better than expected, and make one of the largest additions to the ore reserves since the property was taken over.

The first and second north winzes are 350 feet apart. Drifts were started from both winzes and there remains less than 100 feet to make connection.

All this drifting has been in good ore. One face is now in 3,000 ounce ore, the other in 2,000 ounce ore, and we are practically assured of a continuous ore

body 510 feet long on this level on the north side of the main shaft.

This is particularly gratifying as the showing on this level both in width and values is considerably better than it was on the first level above.

This lower intermediate level will be made the main drive for the exploration of the La Rose Extension claim though it will require 250 feet of drifting to reach the line.

At the north end of the first level the vein had split up into stringers; in the face of the level below, however, which is now a little farther north than the face of the first level, there is a solid nickel and cobalt vein 18 inches wide. This makes the outlook for the north half of the property exceedingly bright.

**No. 3 Vein.**—This vein crosses the main vein, and is opened up by a drift from the first level of the mine.

The stops above this level have shown the ore shoot to be more extensive than the outcrop indicated, and have yielded a good tonnage of first-class ore, which runs uniformly better than 3,000 ounces per ton.

A drift 60 feet from surface, starting from No. 3 raise, is being run east toward the big open cut; the ore is from 2½" to 4" wide, the last samples assaying from 4,900 to 6,700 ounces per ton.

No. 3 shaft sunk at the west end of the big open cut on the hill is 300 feet east of the No. 3 raise referred to above, and on the same vein.

The open cut is 42 feet deep. When it was found that the good ore continued strong in the bottom of this cut, it was decided to sink No. 3 shaft at least to the 100 foot level.

It is now down 65 feet, where the vein is two to three inches wide assaying 5,348 ounces per ton.

An important development has been recently made in the O'Brien No. 2 shaft, which is 200 feet from the south-east corner of the La Rose.

On the 160-ft. level, they have found a new vein 3" to 6" wide carrying much native silver in the calcite. This has been drifted onto within 5 feet of the La Rose line, so it is almost assured that this ore shoot will continue into our property.

It runs parallel to No. 3 vein, about 100 feet to the north. The important point about this is, that the ore occurs in the Keewatin, and at a point 100 feet deeper than our lowest workings on No. 3 vein. This would indicate that the stronger No. 3 vein will continue to be productive to at least the same depth. The recent development on both veins make this south-eastern corner of the property one of great promise.

**McDonald Vein.**—Some stoping has been done on this vein from the tunnel which penetrates the bluff 10 feet above the swamp level.

The ore in the top of the main stope was cut off by a flat fault, but a short cross-cut above the fault, picked up the vein again, where it proved better than it was below, assaying from 3,000 to 6,000 ounces.

In order to develop the McDonald vein at greater depth, a cross-cut was run from the first level of the main mine; this cut the vein 110 feet west of the mouth of the tunnel in the hill, and it has been drifted on for 90 feet. The vein is good, there being two stringers aggregating 3", the ore averaging between 2,000 and 3,000 ounces.

This work proves the vein 65 feet deeper than the hill tunnel, and will doubtless result in largely increased ore reserves on this vein.

**No. 10 Vein.**—When the new company began operations nothing had been done on this vein, although rich ore was in evidence on the outcrop. The estimates made at that time allowed a block 20 ft. x 30 ft. deep with a value of less than \$50,000.

A tunnel was driven into the hill, which cuts this vein 80 feet below the outcrop, and from the point of intersection a drift was run 80 feet on the vein to the Ferland-Chambers line.

The vein is good the whole distance, assaying better than 3,000 ounces over a width of three inches. Besides the high grade ore the country rock is good, the screenings from the broken ore running several hundred ounces per ton.

Up to November 30th this vein has produced \$41,854 worth of ore, and a block of ground 80 ft long x 80 ft. high has been opened up, compared with the estimated block 20 ft. x 30 ft. In addition to this, is the ore body below the tunnel, whose depth is as yet unknown.

**Development Work.**—Extensive exploration work is in progress throughout the mine. A cross-cut is being run lengthwise of the hill on the level of the swamp to cut several cross veins; a parallel cross-cut has been started from the first level of the mine and will run lengthwise of the swamp between the hill and the main vein; and another cross-cut starting at the south end of the mine runs toward the office to develop several veins outcropping near the south line.

About 250 men are employed, double the number at work last June.

New ore houses with shaking tables have been built at the McDonald tunnel, No. 10 tunnel, and at No. 3 shaft; also a new storage ore house on the railroad siding near the main shaft.

**Princess.**—Next to the La Rose proper, the Princess is the most promising holding of the Consolidated, lying, as it does, between the McKinley-Darragh and the Silver Queen, with veins from both sides running toward it.

During the last four months some 300 feet of drifting and cross-cutting has been done from the 50 foot level of the shaft.

Three veins have been developed, all of which carry high grade ore.

No stoping has been done, but over \$10,000 worth of ore has resulted from the development work.

The results have been so encouraging that a new 40-foot head frame, with ore house and picking tables, has been put up, and the shaft is now being sunk to the 100 foot level.

The Right of Way Co. owns a strip 99 feet wide between the Princess and the Silver Queen; on this they put down a shaft and cross-cut to the Silver Queen vein, on which they are now drifting toward the Princess line.

The vein carries six inches of good ore, and as their work is now close to our lines, it is almost certain that this vein will prove of considerable value in Princess ground.

**University.**—A small force has been employed on this property, taking out cobalt ore from an open cut, and in sinking a shaft on No. 4 vein.

The shaft is now down 50 feet, on a small vein 1" to 3" running about 3,000 ounces per ton.

A new headgear and ore house is being erected and the vein will be opened up for stoping.

**On the Violet** some trenching has been done, resulting in the finding of two veins carrying silver values, and I have great hopes of this ground when systematic mining operations are begun.

La Rose Mines, Limited,

R. B. WATSON,

General Manager.

## The Mill-Test for Gold versus The Assay.—A Comparison in the Methods for Non-Technical Men.

H. E. Haultain.

**"TWO AND A HALF TONS OF ORE FROM THE DUMP WERE PUT THROUGH THE MILL, AND YIELDED \$27.50 WORTH OF GOLD."** From a report.

The term mill-test is a time-honored phrase, and is associated in the minds of most miners with honesty and square dealing. It represents something tangible and reliable, something you can feel and see; whereas the assay has something of the hocus pocus about it; it savors of the ways of the alchemist and the mystery-man. The mill-test deals with a comparatively large amount, a ton or two, that you can appreciate in an ordinary everyday way, and it gives you the real stuff that is in the ore that you can handle and weigh on everyday scales. The assay deals with a spoonful, and

gives you a result that can hardly be seen without a glass and which weighs no more than so much dust on commercial scales.

Are two such methods that are so far apart in appearance near each other in results, and which is the more reliable?

In any test there are three sources of error: First, errors due to the limitations of the method and the appliances. Second, errors due to the carelessness or lack of skill of the man in charge. Third, errors due to intentional falsification by the man in charge or by others having access to the test.

In essential principles the mill-test and the assay test for gold in ore are remarkably similar. In each case the ore is first crushed to a fine sand. In the mill

the gold is separated from the sand by alloying the gold with mercury; in the assay by alloying it with molten lead. The gold is separated from the mercury by boiling off the mercury; from the lead by burning off the lead. In the mill the gold is alloyed with the mercury by flowing the crushed sand and water over copper plates coated with mercury. In the assay the sand and gold and suitable fluxes are all fused together with finely divided lead in a small crucible. With the best possible conditions and the most skilled attention the mill will catch only a part of the gold, this part being often less than 50 per cent. of the total gold contents and seldom more than 80 per cent. With ordinary care the crucible will catch practically all the gold; that is, more than 99 per cent. In the mill the mercury-coated plates must of necessity be used over again for different tests. It is impossible in ordinary work to remove all the amalgam (mercury and gold alloy) from these plates; the amount remaining on the plates depends on the skill and care of the manipulator. It is quite possible for some of the gold left on the plates from a preceding test to come off with the next test. The accuracy of the recovery of the gold from the plates depends on the skill and care of the man in charge. In the assay, clean crucibles are used, and the method is such that none of the gold remains behind. In the mill the ore is crushed in mortar box, in which are placed round steel dies. In and about these dies and in and about the corners and rough edges of the mortar box are crevices that will hold much gold. The very greatest care is needed before and after a test to clean out this box, and this cleaning out is a troublesome affair, and even under the best conditions cannot be thoroughly done. In the assay the ore is crushed by appliances specially designed to admit of perfect and easy cleaning, and the final crushing to sand is done on a perfectly smooth iron plate. From all this it will be evident that as far as the actual recovery of the gold is concerned the assay method is very much more accurate than the mill method. In general, if the mill-test is conducted under the best conditions with disinterested care, the result will show a value to the ore below the true value, but it is a very easy matter even when great care is exercised for the gold from one test to affect appreciably the results of succeeding test, especially if the succeeding test be on a low-grade ore. But the usefulness of the resulting gold in each case depends upon the accuracy of the weighing both of the ore treated and of the resulting gold. In the results, but the assayer has for his everyday use ball-mill-test ordinary balances will show fairly accurate ones that enable him to weigh a spoonful of ore with a smaller percentage of error than the mill scales weigh a ton, and he has still finer balances that will weigh his pin's-head of gold more accurately than the millman weighs his small brick. It is simply a question of apparatus, just as the mechanic with his hand micrometer will measure his lathe work to a thousandth part of an inch, while the mason will measure his wall only to the nearest inch. There is no question whatever that as far as the rock actually treated is concerned, the assay is very much more accurate than the mill-test. At first sight, however, the mill-test seems to have a very great advantage in that it handles a large quantity of ore, a ton or more, while the assay treats only an ounce, a small teaspoonful.

This is more a matter of appearances than anything else. The ton and the spoonful are each samples; the ton is only a very small amount compared with the

mine. The ton can be as misleading as the ounce. It is all a matter of sampling. And there is the crux of the whole matter; it is all a matter of sampling; and sampling is an art that has been reduced to a science.

In taking a sample there are two separate and distinct steps. The first is the taking of the sample from the mine, either from the solid unbroken ore or from the dump. This should invariably be of several pounds weight, and may run up into the tons. The second step is the drawing from this large sample of a small one which will accurately represent it. The two steps call for entirely different methods. The first one is by selection, and calls for trained experience, coupled with disinterestedness. This disinterestedness is essential. A foreman cannot sample his own mine, and for the same reason that a doctor will not operate on his own child. The second step is mainly a mechanical one, though it may be done largely by hand. It consists of crushing and mixing and "quartering," repeated until both the size of the largest particle and the size of the remaining sample have been very much reduced.

Everyday experience shows that with proper methods and proper care an ounce will accurately represent a carload.

All the ore sold to smelters (excepting the very richest) is sampled by sampling down the carload to a few ounces, of which less than an ounce may be taken for assay. It is a very common thing for shareholders or directors to ask for a "smelter test," thinking that they get an actual large-size test of their ore. In no case do they get it. Their ore is mixed with other ores long before it is smelted; what they get is a sampling and an assay.

There is, however, this much to be said in favor of the mill-test. Men inexperienced in sampling and honestly trying to learn the value of their prospect will probably get nearer the truth if they take a sample weighing a ton than if they take only a few pounds. But it must be remembered that if the sampler is the owner, or a foreman, it is (psychologically) a difficult thing for him to sample fairly if his mine or his vein is spotty, as most gold veins are, and it will be just as natural for him to get an excess of the better spots into his ton as into his few pounds.

If now, on the other hand, there is anything to be gained by high returns, the larger sample lends itself to salting at every turn. It must be handled by several men; it cannot be kept under constant supervision; it cannot be enclosed in puncture-proof cases. When it comes to the mill-test, if this is carried on in the ordinary mill to which the workmen and others have access, "salting" is the simplest matter. A handful of rich ore, even a spit of tobacco juice containing gold dust, will do the work.

Taken all round, the assay is much more reliable than the mill-test, but without proper sampling neither of them is of any value as a guide.

The art and science of sampling, and more particularly the sampling of ore in place, has been very much developed in the last ten years, and it has now taken its place in most mines of importance as a part of the regular routine work. All ore faces exposed in shafts, raises, drifts, and stopes are regularly sampled every few feet. If this is of value and importance in a regularly running mine, of how much greater importance is it in a new prospect, and if it can be done with sufficient accuracy to enable a man to control his monthly output by using it as a guide, assuredly it is suffi-

ciently accurate to be of prime importance in a partly explored ore body calling for capital. The ridiculing and belittling of the value and accuracy of proper sampling is the regular work of the wildcat promoter. It is a part of his stock-in-trade, on a par with the oft-repeated fiction of "increase in value with depth." To all men interested in mining ventures I say that all exposed faces of ore can be accurately sampled by a trained man without the taking of very large samples. I say further that a few pounds of properly taken samples will give much more reliable information concerning the true value of an ore body than several tons taken at random; and further, that the reducing of a ton sample of gold ore to a few pounds in weight by proper methods and the examining of this small sample in a laboratory will give much more information and more reliable information than a mill-test of the whole ton of ore.

Whence comes, then, this veneration for the mill-test? This is not hard to find. Its value developed in the days when there was no cyaniding or chlorination or smelting, when there was nothing but amalgamation, and what the mill failed to recover was no better than valueless. The question was not "how much gold is there in it," but "how much will the mill save." But

in these days, with advanced methods some means can always be devised for the recovery of most of the gold, and the right question is "how much gold is there in the ore?" and this the ordinary assay determines more accurately than any other method.

In the August 15th, 1908, issue of this magazine I said: "There is not a property in the Larder Lake District upon which sufficient work has been done to justify the presence of a mill, not even of the small three-stamp, so-called, prospecting mill."

These mills were put up for one of two reasons, either to test the ore bodies or else to sell stock. Thirty years ago it might have been justifiable to put up a very small mill to test an ore body, but nowadays the trained mining engineer will get more accurate results than the mill, and at a small fraction of the cost. A fee of \$1,000 and the costs of sampling and assaying will give better information than \$20,000 spent on a mill. But—and here I speak quite seriously—the engineer's results cannot be controlled by the promoter, and naturally, if the purpose is to sell stock, a mill-test on more or less selected ore will be much more efficient for newspaper talk than the cold-blooded facts of the engineer.

## EARLY DAYS IN COBALT.

BY W. G. TRETHERWEY.

It was during the winter and spring of 1904 when my friend, Dr. Milton Hersey, of Montreal, brought to my attention the fact that silver had been found up in the wilds of Nipissing, west of Lake Temiskaming.

Dr. Hersey's observations were that the samples were wonderful, but native silver had, as a rule, proved freakish and unreliable, but that, however, the discovery was worth investigating.

My mind was made up to visit this new country as soon as navigation was open on the Ottawa River and on Temiskaming Lake. On parting with Dr. Hersey I told him that I would inform him of the results of my visit and give him what advice I could as to the prospects in the new country.

To better investigate the finds in the north I decided to settle my family in Toronto for a time. From Toronto I could equip myself with full information as to the mining laws of Ontario, etc. At the Parliament Buildings I was shown every courtesy, and met there some of the men who have made Ontario's Bureau of Mines a credit to the Dominion.

Having ascertained that the ice was clear, I gathered my camp outfit and left Toronto for the north on the 16th day of May, none too late, as patches of snow and ice lay all about after Temiskaming was reached. In those, what appear now, distant days we had to travel to North Bay by G. T. R., thence to Mattawa by the C. R. R. main line, and to Temiskaming by short line, and by boat to Haileybury, then a hamlet of a few houses, a store, a postoffice, and one hotel.

Since that memorable trip it has often occurred to the writer that fortune was certainly on his trail. After leaving Toronto no familiar face appeared. At North Bay the day of my arrival had seen an important event—the sitting of court—and all hotels were filled, and not a bed was to be had. After considerable prospecting, however, I found a man who offered to furnish

a place to sleep, and to this day I think it was the apartment of his daughters. It has often occurred to me that I owed this man substantial thanks, for it was this night's rest that fitted me for what was ahead. Next morning, bright and early, I took train for Mattawa, and thence the short line to Temiskaming Landing, where the boat was waiting to convey the many passengers north, some to the new silver fields (for a few had scented fortune afar off), but more to the backwoods settlements beyond New Liskeard.

In all my tramps abroad it has been my practice to carry a good pair of field glasses. These I was using liberally, examining the shores of the Upper Ottawa, trying to read the different formations, when a bronzed and rugged pioneer with interested and penetrating look upon his face, stepped forward and said: "Are you a mining man?"

I replied that although I was not an expert or engineer, I had mined and prospected to a considerable extent, and that I had heard wonderful stories of a country ahead. He looked hard at me for some moments, and seemed to be trying to read my thoughts. Then suddenly appearing satisfied with his scrutiny, he said, pulling and tugging at something, jagged and irregular, in a lumberman's woollen sock, which had been fished up from the depths of his overcoat pocket, "What do you think of that? What is it?"

The magnificent specimen of silver now held up before my eyes spoke more forcibly than any words could do that I was indeed on "treasure's trail." In it I recognized a piece of almost pure native silver larger than I had ever seen before, as a sample, and it told a story of hidden wealth far beyond anything I had pictured.

This man's name was McKinley, one of the original discoverers of the now famous McKinley-Darragh mine. He assured the writer that he found that piece

lying loose in the gravel by the shore of a small lake; that he and his partner had staked the ground, and hoped to find more.

My desire was to see the place where this specimen came from, and I pressed my new-found friend to show me, which he kindly agreed to do. That night, the 18th of May, we landed after dark at Haileybury, and in spite of the electric lights of the town not being in commission, I managed to find a place to sleep, thanks partly to Mr. McKinley. The following morning being fine, we, as the saying is, "hiked it" over perhaps the roughest trail to what was to be the new silver camp, at that time known as Long Lake (now changed to Cobalt).

Mr. McKinley first took the writer to his claim, and there I had my first experience in washing silver nuggets from the gravel and dirt of the Cobalt Lake shore.

Mr. McKinley did not seem to realize that beneath the debris somewhere there must be a vein hidden, and I suggested to him to start a cross-trench from the water's edge toward the hill, and thus, if possible, cross-cut the vein. This was done, and the vein found from which these rich specimens had come.

From this property we went to see the "Little Silver" vein, as it was called, and there I saw more silver than I had ever dreamed of. From here we visited Cobalt Hill, and the now splendid La Rose mine, which at that time, was a mere discovery, and what a western man would term a prospect.

After ascertaining that no properties were for sale in the new camp, I made up my mind to pitch my tent at Long Lake and prospect. It had rained heavily on the 20th, and it was the evening of the 21st before my camp was put in order, on the ground where now stands the Right of Way shaft-house.

On the 22nd my efforts were in a southerly direction, but I met with stakes and lines on every hand, and I came back to camp determined to try in a new direction on the morrow. This, the 23rd of May, 1904, was an eventful day for me. During all the forenoon and well into the afternoon the day was taken up in working towards the southwest along the chain of small lakes toward and round Pickerel Lake. The formation here I did not fancy, and at 2 p.m. I returned to camp weary and hungry. My man at camp understood the art of cooking bacon and eggs, and after a good lunch and a rest, it being now 4 p.m., I decided to finish the day searching for the silver trail in a quite opposite direction—northwest—a direction I had been assured was out of the mineralized zone. From my camp I headed straight across ridges, over bluffs, and through thick brush and swamp until I came over the bluff west of where the old Trethewey plant now stands. Perhaps it was intuition, or perhaps it was the mere fancy that I had gone far enough to get beyond the zone of stakes and lines of other claims, but here I stopped to examine the rock, in which I recognized the same characteristics I had observed near the veins already discovered in the camp. And I said, mentally, "This is good-looking formation," and at once I decided to follow it along the ridge south. As examination proceeded along the bluff it was evident that other fortune-hunters had been there, but I detected, as I thought, a want of experience by reason of the green moss having been disturbed, and an absence of the evidence of digging in the crevices and cracks, where the silver is usually found. As the bluff was traversed I noticed an almost natural opening or pathway over one portion of the bluff, which at this point jutted out into a swamp.

The other prospectors had evidently taken this easier way. The point, from the swamp side, was covered with fallen trees, underneath which there was room for one to pass round the point of the bluff by wading in the water. The writer was after silver, and a little water or brush had no terrors for him, and beneath these windfalls he was determined to examine. And there beneath this Nature's covering was Nature's prizes. The thing that men work and sweat and hope for—silver in abundance!

It was now 5 p.m., and I was in an unknown forest at least a mile from camp, without any tool but a prospector's pick; and I realized that camp must be reached and an axe brought back for the proper staking of the new find. In the meantime another prospector might come and make the discovery of the presence of silver, in which case the discovery might be lost, as the first discovery post would probably hold the ground. Therefore, I lost no time in returning to camp, and as there was a company of other prospectors sitting round my fire having tea, it was best that I should act rationally and take refreshments as if a mine did not exist for me. All the time I was planning how I might move off with my axe without arousing suspicion that something was doing. After tea I said to my man, in the hearing of all, "I am going over here to cut a particular tree down that I saw, and will return shortly." I passed from camp as if I were on the most trivial errand; but when out of sight the high places were only touched, and in a few minutes I was there to see if someone had discovered my prize. All was well, and no time was lost in erecting a stake on the vein and inscribing date and name thereon. Also a witness tree was treated likewise, after which I had a little time to breathe and look around. It was becoming dark now, and a move for camp was made, which this time was more southerly, further along the bluff. Now, fully imbued with the idea that mineral might be found anywhere, my scrutiny was close as I passed along, and, sure enough, at about 200 feet distance from the first find, which is now the Trethewey mine, the first vein on the Coniagas was discovered. I did not secure a sample from the last find that evening, as it was almost dark, but I left for camp with the absolute confidence that it was there, from the indications I had seen.

I had heard stories about a syndicate that owned all the ground round for miles, and that night I was turning it over in my mind and wondering if it were true, and if my finds would, after all, be taken away. I carefully consulted the Mines Act, and from it decided that I would get the ground, providing the Mines Department lived up to the law. Prof. W. G. Miller (now Dr. Miller) had arrived in the country a few days previous to my discovery, and was camped on the La Rose property at this time. There I repaired, and I anxiously asked him if it was the intention of the Department to enforce the Act, and on receiving an affirmative reply, I told him of my discovery, and the following morning we repaired to the spot, the Professor's assistant, Mr. C. Knight, accompanying us. Dr. Miller was almost a total stranger to me at this time, and from the amused twinkle in his eye when I told him of my hidden millions (before he had seen for himself), it was evident that he had been filled up with prospectors' yarns before. On arriving on the ground, however, his manner became serious, and it was evident he was pleased at the new finds.

Mr. Alex. Longwell, prospecting for Mr. R. W. Leonard, was at my camp and sharing my awning for

dining-room at this time. I asked him to help me measure off the Coniagas—known as J. B. 6 lot—and Trethewey—J. B. 7. For this he and Mr. Leonard became part owners in the former claim. After all staking had been completed I returned to Toronto to have the titles properly attended to. This took considerable time, and it was about the middle of July before the writer received permission from the Department to go on and prospect the Trethewey property.

Things were indeed crude and slow in those early days of Cobalt's development. To get in powder we had to almost beg the officers of the transportation company to carry us small shipments. And \$32 was paid for one box of giant powder at Haileybury. From there in, the road was so bad that it cost a dollar a box to get it to the mines. Our teamster usually loaded up with liquid combustibles, so, he said, if the powder went up going over the jolts, neither he nor his team would know when it happened. Those were the good old days—the summer of 1904—when we were not bothered with specimen hunters, and we were busy digging out the beautiful metal. On Sundays we were rarely disturbed at our bathing in front of the town of Cobalt, for ladies were seldom seen in those parts. Such a thing as stock selling and mining the public, a widely practised art now, was not dreamed of. We were happy; but when returning to civilization with pockets stuffed with nuggets and stories of the great wealth of that land, our experienced mining friends would look with a sort of pity, as if to imply, "I wonder how long before the dream will end?" or "He is not long to remain with us. Mimico will be his portion soon."

This apathy and extreme inattention to Cobalt's importance got a sudden jolt when news came from New York that cheques ranging up to tidy fortunes were being paid for single cars of ore.

The crowd has now gone just as batty in the opposite direction. From a people that nothing could move in 1904, we now have what the world seldom sees—a mad, clamoring crowd buying everything in the form of a Cobalt stock, the end of which spells disaster for many.

The writer had the honor of grading, at his own expense, for the first switch and siding at Cobalt on the T. & N. O. R., and landed the first car of machinery—a boiler, a hoist, and an electric light plant.

I could go on enumerating incidents of Cobalt's early days, but I feel, Mr. Editor, that a good earnest apology is more in order for the space already occupied by this rambling reminiscence. A lesson Cobalt has taught me is that poverty and riches bring out human nature either in its beauty or in its most contemptible form; by them you will know your true friends.

W. G. TRETHEWEY.

### TRETHEWEY MINE.

The Editor, Canadian Mining Journal,

Confederation Life Building, Toronto.

Dear Sir,—In response to your request, I have much pleasure in giving you a synopsis of the operations conducted at the Trethewey Mine up to the present date.

The property is situated on Sassaginata Lake, just outside the town limits of Cobalt, and lies between the Coniagas Mine on the south, and the Temiskaming & Hudson Bay Mine on the north, and marches with one of the locations of the Nipissing Mining Company on the east.

The development work to date has been principally conducted at the south-east end of the property, close to the Coniagas and Nipissing boundary lines.

There are three working shafts on the property, measuring in all over 400 ft., with upraises of over 100 ft.

No. 1 and No. 2 Shafts, approximately 650 ft. apart, are connected by a drift on vein "F" at the first or fifty-foot level.

No. 2 and No. 3 Shafts, a distance of about 110 ft. apart, are connected at the second level, which is 140 ft. below the collar of No. 2 Shaft. No. 3 Shaft has been sunk to a depth of about 200 ft., where a third level is being run east to the Nipissing boundary and west towards No. 2 shaft. The total amount of drifting and cross-cutting in these workings is about 4,000 ft.

Several thousand feet of surface work has been done, consisting of trenching and "open cutting," and several prospecting shafts have been sunk on veins and fissures occurring towards the north end of the property. Owing to the geological conditions there existing, these operations have failed to disclose any ore bodies of economic value, it having been recently proved that the veins at the north end (with one exception, namely the discovery vein on the Temiskaming & Hudson Bay location) do not carry values until considerable depth is reached. This has been recently demonstrated by a tunnel which was run from the workings of the Temiskaming & Hudson Bay property at their 100 ft. level, towards and across the Trethewey north line, where an important body of rich silver ore was encountered at that depth.

Prospecting operations by the diamond drill were also conducted during the past year, the result of which was to locate some valuable veins at depth, and by means of which important geological information was gained.

The system of treating ores for shipment obtaining at the mine is now confined to crushing and hand sorting, followed by partial concentration in a double compartment Hartz jig, to which is being added a belt conveyor and coarse concentrating table to handle the hutch product from the jig. The present operation is so satisfactory that only very low grade ore is being sent to the dump for future treatment. By this means the grade of ore formerly shipped as screenings (running from 100 to 200 oz. per ton and carrying about 70 per cent. of country rock, on which in some instances a heavy penalty was exacted by the smelters) is made to produce a high-grade product, running from 1,500 to 2,000 oz. per ton, thus saving a very heavy expenditure for freight and treatment charges on the bulk of the ore formerly shipped.

As the development work proceeds, the production of ore is increasing, and during the past few months the output represents a net return of over 25 per cent. on the capital of the company, notwithstanding the present low price of silver.

The new ground recently developed by the lower workings is producing ore of high grade equal to the best in the history of the mine, and the large reserves of ore being opened up warrant the belief that the mine has a very promising future before it.

Yours faithfully,

ALEX. M. HAY.

### THE RETIRING TREASURER OF THE CANADIAN MINING INSTITUTE.

After holding the office of Treasurer of the Canadian Mining Institute for ten consecutive years, Mr. J. Stevenson Brown has tendered his resignation. In the early days of the Institute the work of the treasurer-

ship was comparatively light. During the last few years, and especially during the year that has just closed, the enormously increased membership has entailed a correspondingly greater bulk of work upon the treasurer. In addition to collecting and handling the annual fees of each member and controlling the disbursements of the Institute, the disposal of large governmental appropriations has fallen upon his shoulders.

whose chief object and aims were centred in fostering and developing the mineral resources of the Dominion.

"At that time there was, comparatively speaking, but a handful of members, led by that enthusiast of sacred memory, the late B. T. A. Bell, the founder and organizer of the Canadian Mining Institute, and its indefatigable secretary. And surrounded by such men as were attracted to the Institute, mainly through his

MR. J. STEVERSON BROWN, RETIRING TREASURER OF THE CANADIAN MINING INSTITUTE.

Hence it is evident that the position is at present no sinecure.

The following extracts from a recent letter of Mr. Brown's are most pertinent and interesting. We can hardly do better than quote Mr. Brown's own words:—

"I joined the Institute at its inception in 1898, associating myself with a number of men, who recognized that there was a great field for an organization

wonderful personality, it is not surprising that the organization has made a steady march in the direction of progress and that the influence of this man's work should be stamped on almost every page of the Institute's history.

"Working hand in hand with the late Mr. Bell, and closely identified with the early history of the Institute, were John E. Hardman, George E. Drummond, A. W.

Stevenson, George R. Smith, Charles Fergie, Major R. G. Leckie, John B. Hobson, besides several others who have passed beyond the great divide, such as the late lamented Dr. Geo. M. Dawson, James F. Lewis, Roderick Robertson and John Blue. These men were all zealous and enthusiastic workers in the affairs of the Institute in its early days—men of character and ability, indeed I may say of authority, in their respective fields of work.

"At the end of the first year there was a membership of upwards of 150. It was then, on the resignation of Mr. A. W. Stevenson, who was the first Treasurer of the Institute, and at the solicitation of such men as I have mentioned, that I became a candidate for the office so made vacant, and was elected by acclamation.

"Year by year the Institute has continued to grow, until now there are close upon 700 names on the membership roll, not including student members.

"Lack of time prevents me going more into detail. Were it not for that, I could say a good deal about the

difficulties we had to contend with at the start. Bell, of course, was the leading spirit, and his wishes generally carried, often for the reason that he had at command such a flow of language and such an array of proof based on authorities that he could quote by the yard and pour forth in such a whirlwind of enthusiasm that few could face. And be it said to his credit, his plans and convictions were usually right."

Since those early days, upon which Mr. Brown touches so vividly, the Institute has had the full benefit of his continuous services, and his ripening experience. He has now, forced by the demands of his private affairs, decided to resign the office that he has filled honorably and well for ten years. This will not, we hope, mean that Mr. Brown is to sever altogether his connection with the Canadian Mining Institute. We shall still expect to see his cheerful countenance, hear his tales of the heroic days, and listen to his inimitable renderings of Dr. Drummond's poems.

## THE AGAUNICO MINES DEVELOPMENT CO.

We have been requested by Mr. E. L. Fralick, mining engineer to the Cobalt Lake Mining Company, Limited, to give publicity to the following correspondence.

The Agaunico Mines Development Company is incorporated under the laws of Arizona, with a capital of \$500,000. The mine on which this capitalization is based is situated on the shore of Lake Temiskaming. It has produced no silver. It has produced a few tons of high-grade cobalt ore, for which there is a very limited market.

This property was one of the first exploited in the district. The original owners were prominent and capable mining men. The property was thoroughly prospected.

The prospectus is a phosphorescent mass of falsehoods. One S. W. Gilbert describes the property as "a reservoir of solid silver." Mr. Gilbert needs classification by President Roosevelt. Other equally absurd features distinguish this precious prospectus.

When the property was first acquired, and before the prospectus was issued, Mr. E. L. Fralick states that he consented to advise the company as to selection and installation of machinery. He stipulated expressly that his responsibility ended there.

When the prospectus appeared Mr. Fralick immediately protested against the use of his name. The following letters speak for themselves. Mr. Fralick has put the matter in the hands of his attorney:—

Nov. 25, 1908.

E. I. Rosenfeld, Esq.,  
Tacoma Bldg., Chicago, Ill.

Dear Sir,—Enclosed please find copy of letter to Mr. E. J. Bestick, which explains itself.

Yesterday I received a copy of the prospectus of the Agaunico Mines Development Company, in which I am mentioned among the officers as consulting engineer. When I consented to advise regarding the plant and equipment, it was agreed and understood with both yourself and Mr. Martin, that my services ended there. It was explicitly stated by yourself and Mr. Martin that my services were not desired as consulting engi-

neer, but merely to advise regarding the plant. It was definitely agreed and understood that there my responsibility ceased, and that I had nothing whatsoever to do with the mine or the planning of the work.

To-day I am informed that my name is being used on the letter-heads of the Agaunico Mines Development Company. This is also entirely unwarranted and unauthorized by me. I have merely acted in the capacity of consulting master mechanic, something entirely different from that of consulting engineer.

I gave no permission for the use of any letter of mine in the prospectus. A letter which I wrote has been slightly changed and letters tacked on to the end of my name, which are not the proper designation of my degree.

I therefore insist that my name must be eliminated from any prospectus, letter-head or other literature emanating from your office, or in any way connected with the Agaunico Mines Development Company.

I shall await the receipt of satisfactory assurance that this will be done by return mail. I am,

Yours truly,  
(Sgd.) E. L. FRALICK.

(Note.—The following is an answer from Mr. Fralick to an enquiry concerning the Agaunico).

Nov. 25, 1908.

Mr. E. J. Bestick,  
Detroit, Mich.

Dear Sir,—Your letter of the 12th, asking my opinion as to the prospects of the Agaunico Mines Development Company, received. It is not usual for me to comply with such requests, except in the form of a report after due examination. The use of my name, however, by the Agaunico Mines Development Company necessitates this departure.

From my own personal knowledge, I know absolutely nothing of the underground workings of the mine. I have, however, frequently heard competent and reliable men familiar with the mine state that there was in sight there a larger body of high-grade cobalt ore than in any other property in the district.

I am familiar with the work done there in the last couple of weeks. It appears to have been prosecuted in a vigorous and competent manner. Further than this, I know absolutely nothing of the prospects of the Agaunico Development Company.

Yesterday I received a copy of the prospectus of this company, and noted that I am put on its list of officers as consulting engineer. I am not now and never have been the consulting engineer of the Agaunico Mines Development Company. The use of my name is entirely unwarranted, and I am taking the necessary steps to have it stopped.

Nov. 30th, 1908.

Mr. E. L. Fralick,  
c/o Cobalt Lake Mining Company,  
Cobalt, Ont.

Dear Sir,—I am in due receipt of your letter of the 25th inst., and have delayed a few days in answering, as I did not wish to be hasty.

I am frank to say that I have never in my thirty years' business experience been subjected to such unqualified impertinence. Your statements are absolutely without warrant. There is only one of them that is right, and that is that you are not connected with the Agaunico Mines Development Company, and that is right because from the time your letter was received it is needless to say that the Agaunico Mines Development Company would not permit you to be.

I made a definite and unqualified arrangement with you to act as consulting engineer, in the presence of Mr. Martin, the president of the Agaunico Mines Development Company, and you have been rendering some services, but none commensurate with what I supposed your abilities were, or what you were paid to do.

Mr. Whitson assures me, without qualification, that the letter he asked you to write was for the purpose of being embodied in the prospectus, and I know Mr. Whitson well enough to know that he does not make any statements which are not true. Unfortunately, on such matter as we have your name it cannot be taken off, excepting to erase same on such matter as is sent out from our office. This we will take great pleasure in doing. As a matter of fact, you owe both Mr. Martin and myself an apology.

I am sending a copy of this letter to Mr. Bestick for his better information.

Referring to the criticism about the letters "E. M." after your name, beg to say that you yourself told me that you were a mining engineer and a university graduate with that degree. I supposed you were telling the truth.

Yours very truly,

E. I. ROSENFELD,  
President.

P.S.—You will please turn over either to Mr. Rochester or Mr. Martin any such correspondence as you may receive with reference to the Agaunico Mines Development Company.

Haileybury, Ont., Dec. 2nd, 1908.

Mr. E. L. Fralick,  
Cobalt, Ont.

Dear Sir,—I am in receipt of your letter of Nov. 26th, with a copy of one to Mr. E. J. Bestick, Detroit, Minn., and Mr. E. I. Rosenfeld, Chicago, Ill.

Your request that your resignation be accepted, to take effect at once, will be cheerfully granted on one condition, that you retract the last paragraph of your letter to Mr. Bestick, and acknowledge to him that you were retained by the Agaunico Mines Development Company as consulting engineer, to select and see to the proper installing of their machinery, and to direct their underground work, but was at no time to be asked to say where this work might be done.

These are absolutely the duties you undertook to perform, and was paid for, and we had the same right to use your name as we have that of any laborer on our pay roll. Your claim to have been hired to act in the capacity of consulting master mechanic is entirely erroneous, and I doubt very much your right to that title.

I am making this condition with prejudice, and hope you will accept it, before may become necessary to repeat it.

Yours truly,  
(Sgd.) D. K. MARTIN,  
President.

## THE CHROME IRON MINES.

(Special Correspondence.)

Owing to the constantly increasing demand for Canadian chrome iron for the last two years or so operations were carried on more with a view to developing thoroughly the known resources than to prospect or search for new deposits. The principal, and to-day the only company working in the district, is the Black Lake Chrome Asbestos Co. This company has done more for the development of the chrome industry than any other, and it may here be said that the success of the competition of the Canadian article with foreign ores, especially with those from New Caledonia, is solely due to the untiring and energetic efforts of this concern. The presence of silica in chromic iron beyond a four per cent. limit excluded the Canadian ore for a number of years from its application to furnace linings; but to-day ores containing eight and ten per cent. are successfully used for that purpose. This change has greatly stimulated the demand for Canadian ore, so much so, that for the last two years the requirements on the part of United States manufacturers could not be fulfilled. The Black Lake Chrome Asbestos Co. owns most of the productive chrome properties in the Eastern Townships of Quebec, and produces at present almost the whole Canadian output. Two pits are in operation: No. 1 is located not far from the railroad track, about two miles from Black Lake, and consists of an inclined (65°) shaft 400 feet deep. This shaft is in solid crude ore, and it is reported that it delivers mostly all crude high grade ore. The company has spared no money or means to find out the extent of the deposit, both as to depth and lateral extension, by diamond drilling. The mill is located close to the track of the Quebec Central Railway, and consists of 30 stamps, jaw crushers, and 5 Wilfley tables.

The other mine, known as the "Montreal Mine," is located on lot 26, range 11, Coleraine, at a distance of 7½ miles from Chrome Siding, to the east of the railway. It was taken over by the Black Lake Chrome and Asbestos Co. in 1906, and since that time development work has been pushed to an extent that leaves no

doubt as to the very large quantities of chrome ore available at this mine. The mill consists of 15 stamps, jaw crushers, and three Wilfley tables. The production of chromite for 1907 had a value of \$72,901, whereas the value of 1901 reached the sum of only \$25,444.

#### Asbestos Mines.

The asbestos mines in the Eastern Townships of Quebec constitute one of the successful industries of the Dominion. While in the year 1904 altogether ten mills, with a total milling capacity of 3,500 tons per day were in operation, last year (1908) there were 13 mines and mills with a total capacity of 6,000 tons working, and there are in addition at the present time under construction four more mills with a total milling capacity of 1,500 tons. The great advance in the development of this industry may be seen from the following figures:—

|               | Production. | Value.      |
|---------------|-------------|-------------|
| 1904. . . . . | 35,479      | \$1,199,919 |
| 1907. . . . . | 61,985      | 2,483,211   |

In other words, in three years the production increased 75 per cent. and the value of this production over 100 per cent. This great increase is principally due to the great demand for the last number of years from the United States and Europe, and in consequence thereof the old establishments increased largely their mill capacity, and new mines sprang up.

Of special interest in the asbestos industry is the activity which is being displayed at present in the Broughton district. The first mill, that of the Broughton Asbestos Co., was built in 1903. In 1904 the Quebec Asbestos Company followed, and in 1908 the mills of the Eastern Townships Asbestos Company and the Boston Asbestos Company were built, while the big 500 ton mill of the Frontenac is still under construction. It has been shown through recent investigations by Mr. Fritz Cirkel, M.E., of Montreal, that the Broughton asbestos range commences in the third range, and is to be found on every lot numbered 13 of the different ranges of Broughton township, extending right into and through the township of Thetford, and joining the famous rich asbestos-knoll at Thetford village. Commencing with the easterly discoveries, the Cliche asbestos outcrops on lot 13, range 111, we have altogether 13 locations, and working mines, and it is probable that this number may be increased through new discoveries in the near future.

While it must be admitted that for the last six months the asbestos market was very sluggish as a direct result of the financial depression of a year ago, there is now a decided improvement and it is confidently expected that the next year will bring a further favorable change in the situation. It is acknowledged that Canada supplies 90 per cent. of the world's production of asbestos; new discoveries in foreign countries are being made every year, but so far they have failed to enter into serious competition with the Canadian article. The future outlook of the asbestos industry is very encouraging indeed and prompted by the constantly growing number of commercial uses, the industry keeps steady pace with the demands made upon it.

#### THE WORK OF THE KINGSTON SCHOOL OF MINING.

Since its inception in 1893 the work of this school has been of unusually direct benefit to our mining and

metallurgical industries. The short courses for prospectors inaugurated the first session did much to stimulate interest in minerals and their discovery. There followed immediately the summer mining classes, afterwards taken up and extended by the Ontario Bureau of Mines. In 1894 the first mining laboratory erected in Canada was built at the School of Mining, and it immediately became useful to the mining industry. Ores from all parts of Canada were treated for value and process, and this work has become of such importance that the laboratory is now kept open all the year round. When corundum was discovered in Ontario, Professor Miller, then of the School of Mining, was given the task of prospecting the field to ascertain its extent and value. Twenty tons of the ore were treated in the mining laboratory, and a method of concentration worked out. The quality of the corundum was examined, and a method for analysis of corundum and ore was found. The industry, which was later established at Craigmont, Ont., was based largely upon this work. A later example of the value of the mining laboratory to Ontario is seen in the extensive use made of its staff and equipment by Cobalt mine owners. We must add to this that the first Canadian process for refining Cobalt ores was there worked out by Professor S. F. Kirkpatrick. This process is now in operation at Deloro.

This modest wooden building is at present a most interesting scene of activity. Large lots of ore, from one to twenty tons, are there being treated for value and process, and such is the demand for space that the necessity for a larger building is evident.

The chemistry building is also perilously overcrowded. Originally built for 150 students, there must now be provided within its walls class-rooms and laboratory places for 450.

The spirit that pervades this institution is that of intelligent practical service. Its work has in the past been carried on under the disadvantages of inadequate income, and very modest buildings, quite too small in some cases for the needs. To meet the first want the Board of Governors have started a campaign for an endowment of \$200,000. The director of the school, Dr. Goodwin, has been carrying this on for a few months, and we commend it to all our readers who care to invest in a carefully managed institution. It has been said of it in the Ontario Legislature, on the occasion of votes of money for its assistance, that "no institution gives to the province better return for the expenditure of public money." We understand that the School of Mining will appeal to the Ontario Government for the wherewithal to erect the much-needed buildings for mining, metallurgy, and chemistry. Considering the public services rendered by the school, we have no hesitation in sustaining the appeal.

In order to correct a mistake often made in regard to the School of Mining, we note that its charter makes it an independent institution, its corporation consisting of all who subscribe to its funds. The management of the school is completely in the hands of this corporation, which meets annually and elects a Board of Governors.

We append the following tables of attendance taken from the Report of the Dean and Director:—

The statistics for the fifteenth session of the School of Mining make clear that the growth of the school is strong and steady. The numbers are as follows:—

| BY COURSES.                    |       | 1907-7. | 1907-8. |
|--------------------------------|-------|---------|---------|

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

**Port Hood.**—(Note.—The following is a series of extracts from a letter written for the information of the Canadian Mining Journal.)

#### The Port Hood Richmond Railway Coal Company, Limited.

##### 1908 Review.

In going over the plant in connection with the work done for 1908, it strikes one that a very interesting position of affairs is evident here, and while, of course, we have not reached the output anticipated and hoped for last season, due to many facts which, of course, were unforeseen, such as explosion, labor strike, safety lamp installation, shortage of water, and also our inability to get a sufficient number of men, still the condition of the plant and the work generally for the year taken in comparison with the work accomplished at other collieries must be satisfactory, for example, when we commenced the 1908 operations:—

Mine development was practically worked out, and commencing with the close of navigation, the development of the mine for an output of 800 tons per day was proceeded with, and when navigation opened the mine was developed in such a manner that an output of the above amount could have been maintained, and although the output has not reached to the above amount per day, the development of the mine has been maintained, and at the close of 1908 the mine will be in such a state of development as to maintain the output for practically the season of 1909 with very little additional development.

The slope, for the whole distance of 2,800 feet, has been widened, silled and sleepered, and is now in a most excellent condition.

The bankhead has been strengthened and improved in such a manner as to-day to be in a better condition than at any time since this company took hold of it, and all the machinery has been maintained in as good, if not in a better condition than one year ago. In addition, a new picking belt, to enable us to handle 1,000 tons per day, instead of 400 tons per day, has been installed.

One hundred new pit boxes have been added to the stock, while the old pit boxes have been maintained in a good state of repair.

Twenty-seven new and improved wharf cars have been added, in addition to our stock of 1907.

Two new additional pumps, two additional boilers, together with an additional smoke stack, one new wharf engine, giving us three times the capacity of that which we had in 1907, a new conveyor belt for slack coal, by which means all the coal used in the boilers is conveyed direct from the coal pockets to the boiler-house, thereby doing away with a horse and two men, a new engine for the conveyor plant at the boiler-house, one new engine and a conveyor belt, 36 inches, giving double the capacity of the belt we had in 1907, has been added to the wharf plat, also one large boiler capable of handling all the machinery necessary at the pier has been established. The pier itself has been strengthened and put in a better condition than at any time since it was built, and our storage capacity at the pier increased from 900 to 2,400 tons, enabling us to load and handle steamers from 1,000 to 2,000 tons capacity in from four to seven hours. In addition to the above, there is to-day on the plant ample equipment, so far as we can see, to handle next year's business without any additions whatever of a large or costly nature, and altogether the plant is in a most excellent condition, and fully equipped to handle and develop an output of 1,000 tons per day, and also every bit of the plant from top to bottom has been maintained in a very much improved condition over its previous history, and in addition we have greatly increased the reservoir water supply and laid a pipe line to the pier, a distance of over 3,000 feet, for water supply there.

Monthly costs may now be said to be a fixed maximum basis on the output which we are now receiving, giving us ample scope for reducing, and the reduction of the monthly cost is purely a matter of increased output. Now that the mine is just about entering on the stage of pillar work and having reached a stage where the great trouble and annoyances and increased costs arising from shortages in equipment, lack of facilities, etc., have been overcome, the prospects of 1909 over 1908 in these respects are vastly different and much brighter.

The volume of the output for 1909 is a question of men, not a question of the development of the mine or the facility of handling, and if we secure sufficient men, or if the absence of men we can install mine machines, as discussed with the direct-

ors, the volume of output can be placed at whatever may be desired. In going over the statement, it must be borne in mind that the company have placed all of the improvements outlined above, maintained its property, developed its mine and put it in the state which we are now in, absolutely out of the earnings of the company, and we have not increased the indebtedness one cent for 1908, and practically every item mentioned above is fully paid for; only in the case of the boiler and wharf engine are any installments whatever still due.

During 1908 our market has been practically confined to a few places over Nova Scotia, New Brunswick, Prince Edward Island and Quebec, and to all places shipped we have received, with very few exceptions, a good report of our coal. We have not been able during 1908 to reach some of the markets which we had hoped to reach during the early part of the season, on account of shortage of output, but when the last of December of 1908 arrives, providing weather conditions will permit and navigation remains open, we will not have one pound of coal practically left on the plant. All of our output over and above our own boiler consumption will have been marketed.

Outlook for 1909.—In respect to the raising of the volume, the condition of the property and our ability to handle an increased output is very much brighter than 1908. The question of market, however, gives a more interesting feature than that of 1908 inasmuch as the coal prospects generally are not as bright as last year, and in addition we must anticipate and plan for a considerably increased output.

It may be said, in addition, that the property has been raised from one considered of little or no value to one now looked upon as one of the best coal propositions in Nova Scotia. To-day we find a ready market for all of our coal, whereas in 1907 a market was difficult to obtain, although the demand for coal was very strong, and now, with a weak market generally, we find our coal taking one of the first places on the market for quality, which makes the prospect for 1909 bright indeed in comparison to past years.

**Glance Bay.—Naked Lights vs. Safety Lamps.**—In considering the Port Hood explosion at the beginning of 1908, a Cape Breton jury gave as its verdict an opinion that ten men lost their lives "through the explosion of an explosive mixture." This was not a very illuminating verdict, but the jury had appreciated one thing which it is taking a great many mine explosions to teach us, namely, that if the factors which go to cause an explosion had not been present there would have been no explosion.

What are the factors that lead to mine explosions? There is no mystery about it, as some sapient individuals would have us believe there is. We think in every instance the factors may be resolved into two, and two only—the presence of fire in some form with the simultaneous presence of an inflammable substance, or an explosive mixture, this being generally one or all of three things, viz., marsh gas, coal dust, or some form of blasting powder. Fire is introduced into a mine for two purposes only, first as an illuminant, and secondly as a means to ignite powder. True, electric sparks may arise from electric machinery or transmission underground, but this can be confined to one spot, and with proper fittings it can be practically done away with. The blasting side of the question does not enter into present considerations, except that many persons think that the use of the "squib" in gaseous mines should be discontinued in favor of electric firing.

There are three ways to light a mine, naked lights, safety lamps, and electric light. The latter illuminant can be used in the pit bottom and along the main approaches, but its extension into the working places is a problem as yet not satisfactorily solved. We have left for consideration, therefore, naked lights and safety lamps.

The modern safety lamp gives a good clear light, and the first objection to safety lamps, that they gave a light too dim

to be used satisfactorily, cannot now be advanced. The often-repeated statement that safety lamps increase the danger from falls of roof and side because of the limited range of their illuminating power has never been proved, and never can be. Miners' nystagmus was once laid at the door of safety lamps, but it is now known to result from straining of the elevator muscles of the eye, caused chiefly by handpick underholing in thin seams. The magnetic-lock electrically-ignited type of safety lamp with underground relighters disposes of the objection that men have to lose time when their lamps go out. Such time-worn objections as that safety lamps decrease the miner's earning power have been too frequently exploded to need further demolition. The real sum of all the objections to safety lamps is that they cost money, and that is all there is about it. Those, however, who object on these grounds are as the man who will not insure against fire, who one day rues his omission. In this case, however, not only is money at stake, but human lives.

The foolishness of naked lights in coal mines, to our mind, needs no emphasis. A coal mine is a place where inflammable material is dug out, and the surroundings of the men who work underground are such things as coal, wood, an inflammable dust capable of detonation, explosive gases, brattice cloth, and tub grease. The ordinary citizen would not explore the recesses of his attic with a naked light. He is not so foolish as to put naked flame into contact with inflammable material, which is what is done every time a naked light goes down into a coal mine.

The second volume of the British Royal Commission on Mines states that from 1896 to 1905 there were 183 mine explosions in the United Kingdom, of which 119 were caused by naked lights, 12 by matches, and 17 by open or defective safety lamps; or altogether 148 explosions out of 183 occurred from some form of naked light, being 80 per cent. of all explosions. The explosions that occurred about a year ago in such disquieting numbers, accompanied by such dreadful loss of life, all occurred in open-light mines. The recent disaster at Marianna took place in a developing mine, which was to be a model of every principle of safety, and its officials appear to have been sincerely anxious to design a safe mine. Yet disaster came. The Engineering and Mining Journal says: "The mine was known to be gaseous, and safety lamps were supposed to be employed exclusively in it; but—carelessness again—there were some naked lamps." If anything is worse than naked lights from a point of safety it is perhaps mixed lights. The Port Hood explosion, to which we referred above, although trivial compared with the wholesale destruction caused by the explosions in the United States, is nevertheless a case in point, for it was doubtless caused by the contact of a naked light with marsh gas, probably aggravated by coal dust and loose powder. The Hamstead fire in England was directly caused by the criminally careless use of candles underground.

Naked lights are responsible not only for the majority of mine explosions, but also for most mine fires. Any person who is acquainted with the habits that are associated with the use of naked lights in a coal mine will accept this statement. Where naked lights are used they are generally provided by the miners themselves, and smoking is a usual practice in an open-light mine, with the lax discipline that accompanies the two things. The use of safety lamps is always attended by stricter supervision and more consistent discipline than is to be found in naked light collieries.

For the foregoing reasons, and at the risk of being considered extreme, we take the view that the use of naked lights should be prohibited in all coal mines that employ over thirty men at one time, and they should, of course, be forbidden in even these if any signs of gas are present. The French Government recently prohibited the use of naked light in all and every mine of the French dominions. An extensive development of

coal mining awaits us in Canada, particularly in the prairie country. It is very probable that here the work of mining will be easy and conditions of comparative safety may exist. Under these circumstances the use of naked lights may grow, as they have done in the United States, until we are awakened by something resembling the recent epidemic of disaster there. Nowhere in the world has coal-mining been so easy as in the United States, and miners there have gone along from small things to the present day of huge mines and large outputs, until recent events have awakened the country to a belated consciousness that they are decades behind European practice in everything but the accumulation of dividends. We have no fear that such a state of affairs as exists in American mines will ever become the rule in Canada, but if due regard is had to safety in the day of small things, it will have become a habit in the day of larger things that is coming.

We, therefore, repeat the opinion that naked lights should be forbidden, and that nothing but properly approved and tested types of safety lamps be used in every coal mine in the Dominion, with the possible exception of very small mines employing only a limited number of men.

### ONTARIO.

**Cobalt.**—Regulations in force at Cobalt Lake mine:—

#### Notice.

The quantity of explosives brought into the thawing-house shall not at any time exceed the requirements of the mine for a period of twenty-four hours, except where such requirements would be less than 100 pounds.—Mines Act, Sec. 164, Sub-Sec. 4.

The powder boxes shall be opened not closer than at least 100 feet distant from the thawing-house, and all sawdust carefully removed from the cartridges before they are taken to the thawing-house.—Mines Act, Sec. 64, Sub-Sec. 8.

The powderman shall keep the thawing-house and magazine clean and especially see to it that the floors are free from any sawdust in which the dynamite has been packed.

He shall see that the cans are at all times full of thawed dynamite.

He shall change the water sufficiently frequently for this purpose, using no water warmer than that in which a hand can be immersed without scalding.

He shall at least once a week thoroughly cleanse the cans with warm water and washing soda.

No machine man or other person shall approach or enter the thawing-house with a candle or other naked light, but in all cases is to use a lantern.—Mines Act, Sec. 164, Sub-Sec. 6.

Any machine man taking powder from the cans for firing

shall replace the amount taken with unthawed sticks from the racks so that the cans may at all times be kept full.

In preparing the charge, the fuse must on no account be threaded through the cartridge, but it must on all occasions be inserted in the end, and the wrapper securely tied with twine which is always provided for that purpose.

A charge which has missed fire shall not be withdrawn, but shall be blasted, and in case the missed hole has not been blasted at the end of a shift, that fact shall be reported by the foreman of shift boss to the mine captain or shift boss in charge of the next relay of miners before work is commenced by them.—Mines Act, Sec. 164, Sub-Sec. 10.

In blasting a miss-fire the tamping must not be removed by blowpipe or otherwise closer than six inches of the powder or of the cap which has missed fire.

The machine man shall also notify his partner on opposite shift of any miss-fire before work is resumed.

The employees who have occasion to raise the mine doors shall put up the guardrails or close the gates, as the case may be.—Mines Act, Sec. 164, Sub-Sec. 19.

Workmen may not be lowered or hoisted in shafts, in buckets, skips, or tubs.—Mines Act, Sec. 164, Sub-Sec. 23.

All workmen shall be at the mouth of each shaft at the beginning of every shift promptly as the whistle blows.

At the end of each shift or half-shift five minutes and no more before the whistle blows will be allowed workmen coming from the working face, except on Saturdays, when, except in case of firing, workmen shall remain on duty until relieved by the night shift.

Machine men must in no event use any gelignite that is not thoroughly thawed, and the holes shall be charged and fired as speedily as possible before it has time to freeze.

Any employee who absents himself from work without permission from the office or from the foreman will be discharged.

The machine man shall notify the hoist man at least two hours before he will be ready to fire, and the hoist man shall see that a sufficient quantity of powder is thawed by that time.

Unused sticks of powder or portions of sticks must not be left in the shaft-house or hoist-house, but must be taken back to the thawing-house.

Muckers must look for unused powder in the muck and give same to the foreman or shift boss, who shall put it in a place of safety.

**Ardoch.**—Work has been in active operation since September 14th, under the management of Mr. Geo. R. Rogers. A sample of fifty-five tons of ore has been mined from nine different veins on the property, including the 100-foot level, and run through the company's ten-stamp mill. The values recovered were satisfactory.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Halifax.**—Sensational reports, that lack confirmation, are being circulated concerning the discovery under romantic circumstances of rich silver veins. Credence cannot be given this story until full details have been secured.

Dr. Hugo Von Hagen, who is the originator of two bogus coal companies, one supposed to be operating on a large scale at Maccan, and one in New Brunswick, has chosen a name for the latter company that conflicts with an honest operating company. Von Hagen's Maccan property produces, we are informed, about 20 tons of coal per day. In spite of this his company has been paying dividends since August. He is pure fakir.

The output of the Dominion Coal Company for 1908 exceed 3,519,000 tons. This is an increase over 1907. The other coal mines of Nova Scotia will show good increases.

### ONTARIO.

**Miller Lake.**—Native silver has been found on the White claim of Miller Lake Syndicate.

**Cobalt.**—H. P. Davis has organized a syndicate to work the Flynn property on Cross Lake, upon which native silver has recently been found.

The Cobalt Lake Mining Company has on hand, sacked and ready for shipment, three carloads of cobalt ore, two carloads of niccolite ore, and one carload of fair grade silver ore in the ore-house ready for cobbing.

The frame of the O'Brien concentrator will soon be erected.

The Coniagas mill has 20 stamps dropping.

Returns have been received from the two cars of ore shipped a fortnight ago by the Buffalo Company to the Copper Cliff smelter. One of the cars contained concentrates from the com-

pany's own mills, and ran over a thousand ounces to the ton. The car of ore netted 5,000 ounces to the ton, representing a value of \$70,000. This is one of the most remunerative shipments made out of the camp in some time.

A ton of rich ore is being bagged daily from a six-inch vein of smaltite, niccolite and discrasite on the 75-foot level of No. 3 shaft of the Right of Way mine. Silver leaf in places nearly a quarter of an inch thick is also found in this vein also. Another vein three inches in width has been located on these workings, and also shows high-grade ore. A cross-cut will soon be started north in the direction of the Princess vein, which also heads towards the Right of Way.

Work is being prosecuted at the University mine, and by spring regular shipments will doubtless be resumed. A dozen men are now at work on this property, and the shaft on No. 4 vein is now down about fifty feet. It will be continued to a depth of one hundred or one hundred and fifty feet before drifting will be done. This is a narrow vein, having a surface width of between one and two inches, but the ore shows up all the way down. This vein is so promising that Mr. Watson is having a new ore house erected and a good-sized head frame built. With depth the vein may be expected to widen.

The Crown Reserve has contracted with the Denver Smelter to supply 100 tons of ore a month for January and February. This will yield the company about \$200,000.

## BRITISH COLUMBIA.

**Kaslo.**—After an expenditure of about \$250,000 on the Bluebell property, under the supervision of Mr. S. S. Fowler, is working successfully. The zinc concentrating plant is running. Since July lead concentrates to the amount of 2,000 tons have been shipped to the Trail smelter. Zinc concentrates will now be turned out regularly. French capital is behind the Bluebell.

**Nelson, Dec. 19.**—During the past week the most striking feature in mining circles in south-eastern British Columbia was the semi-official announcement by the Canada Zinc Company, Limited, of the successful operation of their electrical reduction plant at this city, with many interesting details.

The 14th gold brick turned out by the Kootenay Bell mine in the Sheep Creek section since last June, was brought here during the week. The brick weighed 84 ounces and was valued at \$1,500.

A shipment of 313 tons of ore was sent from the Silver King mine at Nelson to the Trail smelter during the week.

The total shipments from the district to date now exceed 1,825,000 tons.

**Phoenix.**—H. Gardner, of London, England, one of the largest shareholders in the Granby Company, was a visitor recently, being shown through the mines by Manager A. B. W. Hodges.

Mr. Gardner is in charge of the London office of the American Metal Company, which handles a large amount of Granby copper, Jacob Langeloth being president of both it and the company.

# MINING NEWS OF THE WORLD.

## FRANCE.

The co-operative colliery, "Mine aux Mineurs," near St. Etienne, which has been worked for some years by the syndicate of miners of the Loire district, has gone into liquidation, no funds being available to meet liabilities or pay current wages.

## RUSSIA.

On January 1st the term for duty-free entry of machinery for the gold mines expired. The mining interests are anxious for a prolongation of the term, but it is considered probable that a duty will be imposed.

A great deal of foreign capital is being invested in mining in Siberia. In the Ushka-Menogov districts English interests representing a capital of £1,000,000 have acquired extensive gold properties, and the English Yenissei Copper Co. is conducting operations on a large scale. The question of the influx of foreign capital into the Urals is exciting considerable discussion in the Russian press.

## GERMANY.

At the general meeting of the Verein für die Bergbauliche Interessen, at Dortmund, it was decided to abandon the projected jubilee festivities owing to the Rodbach colliery disaster, and to devote 100,000 marks to a fund for relieving distress due to mining accidents, and a further sum of 400,000 marks to place on a proper footing the existing fund for granting pensions to technical officials in mines and their widows and orphans.

The Mansfeld Copper Co. will shut down work at the Martin shaft, Kreisfeld, as the rich vein of ore that has been worked for 70 years has become exhausted.

## CHINA.

There is considerable activity in connection with the opening of coal mines in Southern China, especially in the Fa Yuen dis-

trict, not far from Canton. It is believed that there are great mineral resources in Kwang Fung Province, and strong appeals are being made to the authorities for permission to develop them. The Government of Kwangsi has appointed a special commissioner to visit the United States and study American mining methods.

## SOUTH AFRICA.

During the last eighteen months or so the tendency to erect more tube mills and put in heavier stamps at the Rand mines has become more marked. At the beginning of 1908 there were 72 tube mills at work, and the stamp duty was 5.8 tons per day. Over 100 tube mills are now running, and the stamp duty in September was 6.4 tons. Some of the heaviest stamps are: Cinderella Deep, Jupiter, and Knight Central, 1,700 lbs. each; Simmer Deep, 1,670 lbs.; Bantjes Consolidated, Geduld Proprietary, and Vogelstruis Cons. Deep, 1,650 lbs. each. The installation of even heavier stamps is contemplated.

The South African Option Syndicate has located four new diamond areas in the Bembesi district of an aggregate extent of 13 square miles.

## UNITED STATES.

Asbestos has been found on the property of the Union Copper Mining and Development Co., in Northern Wyoming, 28 miles west of Sheridan. It is of a good quality, shading from grey to white, and similar to that found in the copper mines of Nevada and Arizona.

The Secretary of the Interior has withdrawn from entry, selection, and location all public lands in Wyoming, Idaho, and Utah believed to contain phosphate rock, pending action by Congress. The list of lands withdrawn was furnished by the Geological Survey as the result of preliminary examination of the field.

The International Smelting and Refining Co., capitalized at \$50,000,000, has been incorporated in New Jersey by Messrs. Frederic Hoff, Richard C. Hunt, and Nelson W. Runnion, of New York, in opposition to the American Smelting and Refining Co.

The actual manufacture of steel at Gary, Ind., was begun on December 21st, when blast furnace No. 12 was blown in. It is estimated that when the mills are in full operation 25,000 men will be employed.

Prof. Wm. Griffiths, a mining expert, of Scranton, Pa., estimates that at the present rate of consumption the coal supply of the Pennsylvania coal fields will be exhausted in 84 years.

## MEXICO.

The Guanajuata-Jalisco Development Co., organized in New York by Mr. Dwight Furness, with \$4,000,000 capital, has undertaken the development of six groups of mines in Guanajuata and Jalisco covering nearly 1,000 acres. Plants costing \$350,000 have already been installed.

The 300-tons copper-matting plant of the Rio Tinto Company, Chihuahua, has been started, and will handle custom ores of Northern Mexico.

Arrangements have been made for the resumption of work at the iron smelting and machine works, Durango, American capital having been invested.

## COMPANY NOTES.

### GRANBY CONSOLIDATED.

The Granby Consolidated Mining, Smelting and Power Co.'s dividend of \$2 per share, payable Dec. 15, will bring the aggregate dividends to \$3,510,000 since the first return to shareholders was made in December, 1902, two years after the organization of the company.

At a meeting of the bondholders of the Dominion Copper Co., on Nov. 30, the National Trust Co. made a report, in which the assets of the company were enumerated. The receiver's statement of liabilities showed that in addition to the bonded indebtedness of \$800,000 and accrued interest there are outstanding claims against the company amounting to about \$75,000, inclusive of the payrolls for the miners for August and September, which aggregated \$20,000.

Pending the sale, the receiver has been authorized by the

court to borrow \$20,000, for the purpose of defraying the expenses of the receivership. The principal item is the cost of power and labor in keeping the mines pumped out and for watchmen at the smelter and other properties of the company. The receiver estimates that his expenses will aggregate \$4,000 per month.

There will be a meeting of directors of the Dominion Iron and Steel Company in Montreal on December 29.

The Nova Scotia Steel Co. has declared a quarterly dividend of 2 per cent. on the preferred stock, payable January 15.

The statement was made at the special meeting of the Dominion Copper Company that the Granby Consolidated had recently made a bid of \$300,000 for the entire holdings of the corporation of the Dominion Copper Co., including its furnaces and smelting outfit.

## STATISTICS AND RETURNS.

### COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt camp, and those from Jan. 1 to date:—

|                           | Week end.   |               |
|---------------------------|-------------|---------------|
|                           | Dec. 12.    | Since Jan. 1. |
|                           | Ore in lbs. | Ore in lbs.   |
| Crown Reserve .....       | 57,000      | 1,123,688     |
| Chambers-Ferland. . . . . | 60,000      | 503,890       |
| Drummond. . . . .         | 40,000      | 1,331,520     |
| La Rose .....             | 151,100     | 8,793,470     |
| McKinley-Darragh. . . . . | 41,340      | 3,322,810     |
| Nipissing. . . . .        | 202,562     | 8,790,502     |
| O'Brien. . . . .          | 127,837     | 6,782,718     |
| Right of Way .....        | 185,480     | 1,486,250     |
| Silver Queen .....        | 127,000     | 1,826,390     |
| Silver Cliff .....        | 120,000     | 318,100       |
| Temiskaming. . . . .      | 60,000      | 1,234,980     |
| Trethewey. . . . .        | 65,000      | 400,670       |
| T. & H. B. . . . .        | 120,000     | 2,433,660     |

The total shipments for the week were 1,357,319 pounds, or 378 tons.

The total shipments for the week were 1,040,640 pounds, or 520 pounds. Total shipments from Jan. 1 to date are 45,585,030 pounds, or 22,792 tons. The total shipments for the year 1907 were 28,081,010 pounds, or 14,040 tons.

**B. C. ORE SHIPMENTS.**

The following are the ore shipments for the week ending Dec. 19 and year to date in tons:—

**Boundary Shipments.**

Total. . . . . 34,758 1,406,199

**Rosland Shipments.**

Total. . . . . 5,440 287,489

**Slocan-Kootenay Shipments.**

Total. . . . . 3,561 131,895

The total shipments for the past week, 43,759 tons, and for the year to date, 1,825,673 tons.

**Granby Smelter Receipts.****Grand Forks, B.C.**

Granby. . . . . 20,536 1,006,659

**B. C. Copper Co.'s Receipts.****Greenwood, B.C.**

Total. . . . . 11,805 343,372

**Consolidated Co.'s Receipts.****Trail, B.C.**

Total. . . . . 7,366 319,942

**Le Roi Smelter Receipts. . . . .****Northport, Wash.**

Total. . . . . 1,273 83,710

The total receipts at the various smelters for the past week were 40,980 tons and for the year to date 1,781,285 tons.

The output of the Crow's Nest Pass collieries for the week ending on December 11th was 18,214 tons, a daily average of 3,035 tons; week ending December 13, 1907, 24,536 tons, a daily average of 4,089 tons.

**B. C. COPPER COMPANY.**

The following sets forth the output, costs and net earnings of the B. C. Copper Company for the six months ending November 30th, 1908:—

| 1908.               | Lbs. Fine Copper<br>produced from B.C. Ores. | Net Profits.* |
|---------------------|----------------------------------------------|---------------|
| June . . . . .      | 891,032 .097c                                | \$25,850      |
| July . . . . .      | 1,038,944 .0812                              | 49,934        |
| August . . . . .    | 1,069,367 .0815                              | 59,634        |
| September . . . . . | 829,282 .1057                                | 23,933        |
| October . . . . .   | 760,811 .1074                                | 20,349        |
| November . . . . .  | 958,438                                      | 47,000        |

5,547,874 lbs.

Profits from other sources . . . . . 5,900

\$232,609

\*Cost production per lb. laid down in New York—Average cost per lb. for 5 months .0932c. This average cost per lb. will be somewhat reduced by lower cost in November details not having been received.

As the billing prices of copper were below the prices at which settlements will be made, the net profits for the six months will be somewhat greater than here shown:—

**Value at Time of Shipment.**

| Shipped.            | Percentage of |         |          |           |               |
|---------------------|---------------|---------|----------|-----------|---------------|
|                     | Copper        | Silver  | Gold     | Total     | Gold and      |
|                     | Value.        | Value.  | Value.   | Value.    | Silver Value. |
| June . . . . .      | \$88,339      | \$3,813 | \$27,986 | \$120,156 | 26 per cent.  |
| July . . . . .      | 135,899       | 5,592   | 46,398   | 187,859   | 28 per cent.  |
| August . . . . .    | 173,153       | 6,878   | 62,237   | 242,278   | 29 per cent.  |
| September . . . . . | 115,609       | 4,274   | 39,823   | 159,706   | 28 per cent.  |
| October . . . . .   | 98,328        | 3,745   | 37,635   | 139,718   | 30 per cent.  |
| November . . . . .  | 134,535       | 4,871   | 48,972   | 188,378   | 29 per cent.  |

The company ceased operations at its mines and smelting plant November 26th, 1907, and resumed on June 1st, 1908.

The following are the figures of German consumption of foreign copper for the months of January and October, 1908:—

Imports of copper . . . . . 135,347 tons.  
Exports of copper . . . . . 7,342 tons.

Consumption of copper . . . . . 128,005 tons.

as compared with consumption during the same period in 1907 of 96,395 tons. Of this quantity 124,408 tons were imported from the United States.—Reported by L. Vogelstein & Co., New York.

**DECREASED PRODUCTION IN 1907.**

The total production of gold and silver in the United States in 1907, according to figures published by the United States Geological Survey as the result of conference and adjustment between that bureau and the Bureau of the Mint, was valued at \$127,735,400.

The total production of gold for the year was 4,374,827 fine ounces, valued at \$90,435,700—a decrease, when compared with the production in 1906, of 190,506 fine ounces, worth \$3,939,100.

The production of silver in 1907 amounted to 56,514,700 fine ounces, with a commercial value of \$37,299,700. As compared with the production of 1906 this is a decrease in quantity of 3,200 fine ounces and in value of \$956,700.

**MARKET REPORTS.**

December 23:

Connellsville coke, f.o.b., ovens:—  
Furnace coke, prompt, \$1.80 to \$1.90.  
Foundry coke, prompt, \$2.15.

**Metals.**

December 23:

Tin, Straits, 29.25 cents.  
Copper, prime Lake, 14.37½ cents to 14.50.  
Lake arsenical brands, 14.37½ cents to 14.50.  
Electrolytic copper, 14.12½ cents.  
Copper wire, 15.75 cents.  
Lead, 4.20 cents.  
Spelter, 5.12½ cents.  
Sheet zinc, 7.50 cents.  
Antimony, Cookson's, 8.12½ cents.  
Aluminium, 24 cents.  
Nickel, 40 to 47 cents.  
Platinum, \$22.50 to \$23.50 per ounce.  
Bismuth, \$1.75 per pound.  
Quicksilver, \$45.00 per 75 lb. flask.

## Amatite ROOFING

Hume Saw Mill, Fairfield, Me.

### Why Use Paint to Protect Your Roof?

WHY not get a roofing in the beginning that will protect itself—that needs no painting?

All smooth surfaced ready roofings require a coat of paint or some liquid every year or so. The roofing itself merely acts as a base for the paint. If you fail to put it on, your roof doesn't last very long.

Amatite Roofing requires no paint of any kind. It gives protection from the moment you lay it on until it is worn out, without spending another cent for extras.

Its *real mineral surface* makes this possible.

What you spend merely for paint and repairs on other roofs will in a few years pay entirely for an Amatite roof.

For Farm Buildings it is specially satisfactory and economical.

Anyone can lay Amatite. It requires no skilled labor. Nails and liquid cement for laps are furnished free with each roll.

Write for **Free Sample** and Booklet and investigate its merits for yourself.

**PATERSON MFG. CO., Limited**

Toronto Montreal Winnipeg Vancouver St. John, N.B. Halifax, N.S.

### A NEW AND IMPORTANT PUBLICATION

Of interest to all Coal Mine Operators and Mining Men generally.

# The Dominion Coal Company

An Historical and Descriptive Pamphlet of 128 pages

Fully illustrated with half-tone diagrams and maps

The descriptions of the mining methods, fire-fighting and life-saving organizations, cabin conditions, transportation facilities, etc., etc., of the Dominion Coal Company's huge enterprise are well worthy the attention of both technical workers and investors.

Mr. F. W. Gray, the author of this brochure, has done his work most capably.

The book has just appeared from the press.

Its price is **\$1 net.**

# A Handy Reference List

We urge you to examine the books listed below with great care. Some are brand new—all are standard. We can supply any technical book in print

## Copper

### Principles of Copper Smelting

BY EDWARD D. PETERS,

*Professor of Metallurgy, Harvard University.*  
612 pages, 6x9; cloth. \$5.00 (21s.) postpaid.

### Modern Copper Smelting

BY EDWARD D. PETERS.

640 pages, 6x9; cloth. \$5.00 (21s.) postpaid.

### Copper Mines of the World

BY WALTER HARVEY WEED.

376 pages, 6x9; cloth. \$4.00 (17s.) postpaid.

### Notes on Lead and Copper Smelting and Copper

#### Converting

BY HIRAM W. HIXON.

128 pages, 6x9. \$3.00 (12 6) postpaid.

### Pyrite Smelting

BY T. A. RICKARD,

*Formerly Editor of THE ENGINEERING AND MINING JOURNAL.*

210 pages, 6x9. \$2.00 (8 6) postpaid.

### Matte Smelting

BY HERBERT LANG.

98 pages, 6x9. \$2.00 (8 6) postpaid.

## Lead and Zinc

### The Metallurgy of Lead

BY H. O. HOFMAN

*Professor of Metallurgy, Massachusetts Institute of Technology.*

600 pages, 6x9. \$6.00 (26s.) postpaid.

### BOOKS BY WALTER RENTON INGALLS,

*Editor of THE ENGINEERING AND MINING JOURNAL.*

### Lead and Zinc in the United States

6x9; cloth. \$4.00 (17s.) postpaid.

(Price subject to change)

### The Metallurgy of Zinc and Cadmium

701 pages, 6x9; cloth. \$6.00 (25s.) postpaid.

### Lead Smelting and Refining

336 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

### Production and Properties of Zinc

328 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

## Gold and Silver

### The Chemistry of Cyanide Solutions

Resulting From the Treatment of Ores.

BY J. C. CLENNELL

164 pages, 6x9 cloth, illustrated, \$2.50 (10 6) postpaid.

### Practical Notes on the Cyanide Process

BY FRANCIS L. BOSQUI, PH. B.

*Superintendent of the Standard Consolidated Mining Company's Cyanide Works, Bodie, Cal.*

201 pages, 5½x9, illustrated, \$2.50 (10 6) postpaid.

### Stamp Milling of Gold Ores

BY T. A. RICKARD.

6x9; illustrated. \$2.50 (10 6) postpaid.

### Hydrometallurgy of Silver

BY OTTOKAR HOFMANN:

336 pages, 6x9; cloth. \$4.00 (17s.) postpaid.

## Iron and Steel

### The Manufacture and Properties of Iron and Steel

BY HARRY HUSE CAMPBELL,

*Metallurgical Engineer for the Pennsylvania Steel Company, etc.*

Entirely revised in 1907. 641 pages; 6x9; illustrated. \$5.00 (21s.) postpaid.

### The Metallurgy of Iron and Steel

BY BRADLEY STOUGHTON,

*Adjunct Professor of Metallurgy, School of Mines, Columbia University.*

Fully illustrated; 6x9. \$3.00 (12 6) postpaid.

### The Metallurgy of Steel

BY HENRY M. HOWE, A.M., S.B., L.L.D.

9x12; fully illustrated. \$10 (42s.) postpaid.

## The Manual of Fire Assaying.

BY CHAS. H. FULTON

176 pages, 6x9, illustrated. \$2.00 (8 6) postpaid.

Immediately upon its publication the leading assayers, metallurgists and professors of the country hailed this as the best work yet issued on the subject. It substitutes exact knowledge for the rule-of-thumb.

## Ore Dressing

BY ROBERT H. RICHARDS.

*Professor of Mining, Massachusetts Institute of Technology.*

Two volumes. 6x9; cloth, 1250 pages. Profusely illustrated. Per set, \$10.00 (42s.) postpaid.

The standard authority on all classes of ore dressing by one of the leading mining authorities of the world.

SOLE AGENTS FOR CANADA.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## ENGINEERS, METALLURGISTS AND GEOLOGISTS

## THE ROAD TO GOWGANDA

BY THE  
CANADIAN NORTHERN ONTARIO ROUTE

is thirty miles shorter than any other. Beginning February 2nd, through sleepers leave Toronto, 5 p.m. arriving Sellwood (Moose Mountain Iron Mines) next morning. (Breakfast served on train.) From Sellwood to Gowganda is one day's sleigh ride over the company's own road; comfortable road houses are stationed at easy distances and a fast freight and passenger service has been inaugurated with all points in Canada. Inquiries invited:—

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

## Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is \$5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only \$2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, \$10.00 per acre, and on lands situate less than 20 miles from such a railway, \$20.00 per acre:

Superficial products and building materials are sold \$2 and \$4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed

lands; work must be bona fide begun within two years and \$500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of \$10.00 and a rent of \$1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts.

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

**The Hon. Minister of Colonization, Mines and Fisheries**  
Parliament Buildings, Quebec.

### SAVE HALF THE COST ON YOUR ASSAYS

How many samples have you sent to your assayer during the last year which showed no values? A test with Way's Pocket Smelter would cost you only five cents and could be made right in your office or in the field in less than five minutes. If your sample shows values, send it to an assayer, if not waste no more money on it.

We want you to know more about this Outfit which is saving money for so many prospectors, miners and mining men all over the world. An outfit which is guaranteed to give an accurate test on any ore of commercial value. An outfit of which one of our customers said, "is as far ahead of a pan as an electric car is ahead of a burro."

Send for illustrated folder today.

**WAYS POCKET SMELTER COMPANY**  
**SOUTH PASADENA, CALIFORNIA.**

For the Assayer

### Superintendency Wanted

Mining Engineer desires position designing, erecting and operating a concentrating plant. Am experienced on the ores of the Cobalt District, and will submit recommends from present and previous employers as to ability, reliability and working qualities. The superintendency of a mine would also be considered, or of both mine and concentrating plant.

Address all letters to

"SMELTER,"

Care of Canadian Mining Journal.

### Salesman Wanted

For Mining and Milling.

Machinery Engineer with Factory and Selling experience preferred.

Apply in writing with full details as to experience, references, and salary required, to

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

# The Crow's Nest Pass Coal Co.

LIMITED

OFFICES

Manning Arcade, Toronto

Fernie, British Columbia

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

CHAS. SIMISTER,

General Superintendent.

J. D. HURD,

General Manager.

## Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

W. W. CORY, Deputy of the Minister of the Interior

## Montreal Steel Works, Limited

OFFICE AND WORKS :

St. Patrick St., Montreal

### MANUFACTURERS

of Steel Castings of all kinds, Springs, Frogs and Diamond Crossings

*We make a specialty of*

### Manganese Steel Castings

*for Mining purposes.*

AGENTS FOR

THOMAS FIRTH & SONS, Limited

"Speedicut" high speed steel, tool steel, axe steel, saw steel, files, etc. A large stock carried in our Montreal warehouse.

Also Agents for Barrow, Haematite Steel Company, of Barrow in Furness, England.

Steel Rails of all kinds, Fish Plates, etc.

## RAMPART CEMENT

Perfectly Sound. Never swells or bursts.

Reliable for all purposes for which hydraulic cement is used.

Fineness 92 per cent. through a 200 mesh sieve.

Strength up to standard specifications, and permanent.

Used by the leading Mining Companies of the Maritime Provinces.

### Sydney Cement Co., Ltd.

*Rampart Brand*

**SYDNEY, NOVA SCOTIA, CANADA**

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors For Mine Work

## The operation of pumps with Westinghouse Motors

will in almost all cases, excepting in very large water works, show a far greater economy than with steam-driven units. The power delivered at the pump shaft by a Westinghouse motor is at the same economical rate as that of the highly efficient engines in the power house, less the small electrical losses

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.

## The "Little Hardy" Coal Cutter

Holes at Floor Level or Roof Level or in any intermediate position in Coal or Dirt Band, &c.

Equally suitable for Holing and Shearing.

The Lightest Coal Cutter in the Market.

Nearly 700 Machines at work. 93 in use by one Canadian Company.

## The Hardy Simplex Hammer Drill

Weight 22 lbs. Bores 6 ft. Deep.

Automatically Rotates the Drill Steel and lows out the Cuttings  
FOR SINKING, &c.

**SOLE MAKERS**

**The Hardy Patent Pick Co., Limited**  
SHEFFIELD, ENGLAND

Stocks of these machines kept by Messrs. A. C. Thompson  
Co., Limited, North Sydney, Nova Scotia, Canada.

## Why Not Try A "CLEVELAND" STOPE DRILL

### OUR PROPOSITION.

We will gladly ship you a complete equipment for trial, and guarantee that it will do more work than any similar machine on the market at less cost for maintenance.

Our aim has been to make an efficient, "fool proof" simple and durable machine, and we ask that you give us a chance to prove that we have succeeded.

TRY ONE WITH YOUR OTHER DRILLS AND SEE THE DIFFERENCE.

BULLETIN 40.

**The Canadian Cleveland Drill Co.,**  
COBALT, ONT. Limited.

**The JEFFREY  
26-B "SHORTWALL"  
ELECTRIC COAL CUTTER**

For room and pillar work on the  
Longwall plan

It cuts faster, consumes less power per cubic inch of coal cut, occupies less space, permitting the props to be set closer to the face of the coal, is more easily controlled, operated and handled, is simpler and has greater strength, motor power and endurance

Than any other make of SIDE CUTTING MACHINE

This machine is loaded, unloaded, moved to and from the coal face and in fact handled throughout by its own power.

FULLY DESCRIBED IN BULLETIN No. 14

"Write for catalogs series "X" and mention subjects in which you are especially interested."

## Corliss Steam Driven Air Compressors

Corliss Steam Engine of a Rand Air Compressor.

The efficiency of the Corliss Steam Driven Air Compressor in fuel consumption, automatic regulation and smooth action is generally conceded by the engineering world. By reason of its strength, durability and reduction of clearance losses to a minimum when running at speeds permissible in air compression, the Corliss engine is especially adapted as the power end of an air compressor.

Designed to fill the demand for an air compressor of the highest possible efficiency, our Class "BB-3" is producing results in actual operation which we can confidently place in comparison with those of any other machine now in the market. We feel that the compressors of this type which we have running in the various industrial and mining centres of Canada are the best testimonials which we have of our success in the production of air compressor efficiency.

**"THE BEST IS THE CHEAPEST". Get our Estimates.**

# Dry Concentration

## ABSOLUTELY DUSTLESS

# The Behrend System

THE Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

### SALARIES AND THE SURVEY.

Within the memory of the present generation there has been no substantial increase in the salaries of the officers of the Geological Survey of Canada. Meanwhile, no one will dispute the statement that the cost of living is easily 30 per cent greater than it was ten years ago. House rents have crept up amazingly. Provisions bring prices sometimes 100 per cent. higher than those obtaining in the early nineties. And so on through the whole gamut. We could dwell with deep conviction upon the iniquitous tailor, the destructive milliner, the reprehensible plumber, the callous coal man, and the aestival ice man.

These things being so, it is not to be denied that the salaries of yesterday are altogether out of keeping with the conditions of to-day. To expect a competent geologist to exist contentedly upon the pittance offered him by the Government is out of all reason. There may be some degree of justice (we grant it merely for argument's sake) in keeping the salaries of office men and clerks down to the minimum. But between these and the officials of the Survey there is nothing in common. The geologist is a specialist of the highest class. He is a pioneer, an explorer, a scientist, an author and a producer. There is nothing more remote from economy than attempting to retain his services for pay that will not permit of his living in comfort. Already our own survey has lost some of its best and brightest members. In every recent case those who have resigned their billets at Ottawa have been engaged by private corporations and are receiving salaries from three to five times larger than those offered by the Government. Whilst we are still able to point with pride to the men who constitute the staff of the survey, there is no lack of evidence that the growing demand for field geologists will, sooner or later, rob that staff of its best and brainiest.

The geologist is no money-grabber. Possibly his commercial sense is under-developed. But he has an inalienable right to secure as good a living as he can. His efforts are constantly revealing new sources of wealth to the public—wealth in which, if he be an official in Government employ, he cannot participate. If, after some years of miserably underpaid work on our Survey, he accepts a flattering offer from persons who know his value, who can blame him! Yet we are confident that, since for many good reasons there is a certain professional glamour pertaining to the work of Survey officials, but very few members of the staff would hesitate to remain in the employ of the Government for salaries much smaller than they can easily obtain outside. But these salaries must be considerably larger than the meagre allowances of to-day which are

consonant neither with the dignity of the Canadian Government nor with the requirements of modern life.

### THE GRANBY CONSOLIDATED.

Through the courtesy of Manager A. B. W. Hodges of the Granby Consolidated Mining, Smelting & Power Company, Limited, Grand Forks, B.C., we are able to present on another page of this issue a summary of the progress made by his company during the past year.

We wish to note a few salient facts that are presented in Mr. Hodges' communication.

The Granby smelter treated more than one million tons of low-grade copper ore, producing therefrom 23,535,009 pounds of copper. There was no serious interruption throughout the year. Not only were the records of former years excelled, but large additions were made to the smelting plant. At the mines the necessary development work and diamond drilling were not neglected.

The capacity of the smelter is now about 3,000 tons of ore per day. During this year, when the company's plans for enlargement shall have been completed, the plant will have an ore capacity of 4,000 tons per day.

The vigorous and sanely constructive policy pursued by Manager Hodges is an object lesson to Canadian mine managers. Those who are familiar with conditions in southeastern British Columbia will appreciate the vigilance and strength with which the affairs of the Granby Consolidated are administered.

### PARLIAMENTARY REPRESENTATION.

The desirability of parliamentary representation for the larger Canadian universities has been discussed editorially by the daily press. For the present it is probable that no definite action will result from this discussion. No agitation is perceptible. Apparently the country is hardly prepared to act upon a suggestion that, though good in itself, requires a deal of digestion. And, no doubt, our universities are content to wait the fullness of time.

Meanwhile the mining industry suffers from an actual absence of representation in our legislatures. At Ottawa we need, and must have, not one but several members of parliament and senate, appointed primarily to guard mining interests. An industry whose annual output is valued at one hundred million dollars can claim a right to a considerable voice in the administration of national affairs.

Possibly a good beginning would be the selection of a suitably qualified mining man to fill one of the vacancies in the senate.

### MINE ACCIDENTS.

The distressing frequency with which accidents are occurring in the mines of the Cobalt regions calls for strong comment. In the Seventeenth Annual Report

of the Bureau of Mines of Ontario, Mr. E. T. Corkill, Provincial Inspector of Mines, sounds a note of warning. After analysis of the tale of accidents for 1907, Mr. Corkill concludes that due care on the part of superintendents and workmen would prevent many of these fatalities. This is true also of practically all the recent mine casualties.

The employment of incompetent workmen in any positions where their ignorance or unfitness may endanger the lives of their fellow-laborers is unjustifiable. The careless superintendent or foreman begets carelessness in his men. The vigilantly watchful superintendent inspires those under him with a sense of their individual responsibility.

When then it can be stated that a large percentage of the accidents occurring in the mines of the Cobalt district are traceable to neglect on the part of superintendents or workmen, or both, it is high time that some examples were made. The man, whether he be boss or mucker, who through disregard of all reasonable precautions imperils the lives of his fellows, is essentially a criminal, and should be treated as such. Undoubtedly, offenders of this class deserve the most rigorous punishment.

### DIKES AND VEINS.

To those who wish to acquire an accurate conception of the geology of the Montreal River district we recommend the excerpts from Dr. Barlow's report that appear on another page of this issue. On another page, also, Dr. Barlow replies to Mr. Tyrrell's criticisms. We shall not touch upon the controversial points, for when doctors disagree the role of spectator is most profitable.

We desire, however, to draw attention to a recommendation made by Dr. Barlow. "The use of the terms 'dike' and 'vein' as separate names in regard to pegmatite is misleading. The strict limitation of their meaning has led to certain misconceptions as to its manner of formation. I would prefer," says Dr. Barlow, "to make the two terms synonymous, or, better still, to use 'vein' in both senses, for, accurately speaking, every 'mineral vein' is intrusive into the surrounding country." This sounds suspiciously like common sense. Let us, by all means, simplify our heterogeneous technical terminology. If "dike" offends us let us cut it out.

### RESCUE APPARATUS.

It is to be hoped that the subject of life-saving in coal mines will be one of the topics chosen for discussion at the March meeting of the Canadian Mining Institute. There is, certainly, no subject that more needs publicity. Apart from the collieries of the Dominion Coal Company at Glace Bay and those of the Nova Scotia Steel and Coal Company at Sydney Mines,

there is not a colliery in Canada equipped with rescue apparatus.

Considering the rapid extension of the coalfields of Alberta, Saskatchewan, and British Columbia, it is pre-eminently desirable that fully equipped stations be established at suitably central points where groups of mines could be served. Such a station is proposed for Pictou County, Nova Scotia, where the collieries of the Acadia Coal Company and of the Intercolonial Coal Company are situated. Perhaps the best demonstration of the practical utility of rescue apparatus was given last year, when a party of fire-fighters was sent by the Dominion Coal Company to fight a conflagration in the workings of one of the Nova Scotia Steel and Coal Company's mines. Since then the latter company has ordered equipment for its own collieries.

From both the humanitarian and the business points of view rescue apparatus, providing means of respiration in irrespirable atmosphere, is a modern necessity. The Canadian Mining Institute will do well to encourage, by every means possible, the general introduction of any approved type of apparatus in Canadian coal mining centres.

#### FROM REAL LIFE.

A mining engineer, manager of a well-known Ontario mine, has sent us a naive document. From a town in one of the middle states a searcher after truth addressed a letter to our correspondent, who, in turn, has forwarded it to us.

The letter consists of a series of leading questions concerning certain Cobalt mines. Not only does the enquirer demand specific information about these enterprises, but he requests that the opinions of the engineer's friends be obtained. "I would like very much," declares this ingenuous citizen of the great republic, "for you to answer by return mail and state what you and others, who should know, think."

As if to bind the engineer irrevocably, a dime (ten cent piece) was cunningly affixed to the back of the letter by means of mucilage. Under it is a legend that should be preserved: "Please buy Canadian stamp for my return directed envelope and please keep balance for trouble in replying." That he might be sure of receiving full measure for this staggering fee, the writer takes advantage of a blank space remaining to subjoin one last query.

Fantastic as is this letter, it is not altogether out of keeping with the attitude of the public towards mining engineers. We know of many instances that illustrate this point. Often the mining engineer is offered a fee at which a bricklayer would scoff.

#### A CONTRADICTION.

Positive assertions have been made in late newspapers to the effect that the O'Brien Mine, Cobalt, has

been sold. There is no foundation for either assertions or rumors on this point. We are authorized to state that no such transaction has taken place.

#### A CORRECTION.

In the statements of ore shipments from Cobalt the O'Brien Mine has been done an injustice through the omission of the figure indicating millions of pounds. It will be noticed that the O'Brien, in point of view of tonnage, is third in the list of shippers.

#### CANADIAN MINING INSTITUTE.

The following is a list of gentlemen elected to membership at council meeting held on December 5th, 1908: Wm. J. Elmendorf, M.E., Box 1039, Spokane, Wash., U.S.A.; W. A. Fairchild, M.E., Nipissing Mines, Cobalt, Ont.; H. E. Lawson, M.E., 38 Elgin Ave., Toronto, Ont.; Joseph T. Mandy, M.E., Box 585, Cobalt, Ont.; Morgan C. Milne, Elk Lake, Ont.; John T. Shadforth, Victoria, B.C.; Henry Strangways, Crean Hill Mines, Victoria Mines, Ont. Associate Members—A. E. Bowers, Northport, Wash., U.S.A.

Mr. Henry Strangways was formerly a student member.

The following drafts have been returned (wrong address): Frank M. Perry, 27 Walmer Road, Toronto, Ont.; Chas. H. Hayes, 114 Bay St., Toronto, Ont.; B. B. Harlan, 9 King St. West, Toronto, Ont.; W. K. McNeill, Toronto, Ont. (address insufficient); R. J. Gaskin, Kingston (left there, said to be in Toronto). The Secretary of the Canadian Mining Institute will deem it a favor if the above named members will forward their present addresses to him. His address is Room 3, Windsor Hotel, Montreal.

To show how great may be the generation of static electricity in German factories, Prof. M. M. Richter has drawn sparks an inch to an inch and a half long from a 5-inch belt on a wheel making 10,000 revolutions a minute. The risk of explosion in dust or gases seems to have been overlooked. Coating with bronze or aluminum powder prevented static charges, while a weekly application of acid-free glycerine was a remedy and added durability to the leather.

When such substances as glass or porcelain cannot be used for acid-proof apparatus, platinum has been the one material available, but for many purposes this is too costly. As a substitute, M. Jouve, a French engineer, has announced a series of alloys which he calls, "metillures." These are silicides of iron and manganese, with a large percentage of silicon, and they are so resistant to strong acids, hot or cold, that they have been employed in distilling nitric acid and in concentrating sulphuric acid.

# A RESUME OF THE NOVA SCOTIAN COAL MINING INDUSTRY FOR 1908.

By F. W. Gray.

In the 1907 resume we forecasted for 1908 a steady increase in coal production, and on the whole the forecast has been maintained. The progress made is, however, more real than apparent, because 1908 has been a year of financial depression, and the market has not admitted of the increased outputs that Nova Scotian coal mines are prepared to produce when the demand arises. An approximate estimate of 1908 shipments compared with the figures for 1907 as follows:—

|                                | 1907.     | 1908.     |
|--------------------------------|-----------|-----------|
| Dominion Coal Company.....     | 3,156,000 | 3,200,000 |
| Nova Scotia Steel & Coal Co... | 630,000   | 640,000   |
| Acadia Coal Company.....       | 322,000   | 320,000   |
| Cumberland Ry. & Coal Co....   | 276,000   | 350,000   |
| Intercolonial Coal Co.....     | 274,000   | 240,000   |
| Inverness Ry. & Coal Co.....   | 243,000   | 260,000   |
| Port Hood .....                | 64,000    | 100,000   |
| Other companies .....          | 150,000   | 150,000   |
|                                | 5,115,000 | 5,260,000 |

In common with the remainder of the Dominion, the province had an early and open spring, and a summer of exceptionally fine and dry weather. Coal shipments to Montreal commenced about six weeks earlier than in the previous year, and the lead gained was well maintained until the month of September. Towards the end of this month the navigation of the St. Lawrence was greatly hindered by the smoke from forest fires, which for weeks together obscured the river from Gaspe to Montreal. The weather was serene and sunny, and at times the blue haze of the smoke reached as far as the Cape Breton coast. Notwithstanding, however, the serious delays from this cause, the tonnage of coal shipped from Nova Scotia to St. Lawrence ports during the season of 1908 was the largest in the history of the trade. The Dominion Coal Company's shipments for the season totalled 1,346,000 tons. Their St. Lawrence shipments during 1907 were 1,146,000 tons, a record figure at that date.

As previously intimated, the season's shipments would have been very much larger had it not been for the marked depression in the demand which characterized the late summer. Nova Scotia did not feel the full reflex of the financial panic of the previous October until the autumn. The mining centres, indeed, were not affected until the cessation of shipments to the St. Lawrence.

One other feature of the season just past, which at the present time is exercising an adverse influence on the coal mines of Nova Scotia, is the persistent and strenuous attempt which is being made to introduce United States coal into Quebec and Ontario. The United States operators are evidently making a determined effort to capture the Canadian market, and the recent proposals of the Pittsburgh coal operators asking for free customs entry of United States coal into the Dominion, are not without their significance to the Nova Scotia mining industry.

For many reasons United States coal can be put on the Montreal market in better physical condition than coal from Nova Scotia. The very excellence of the Cape Breton coals, for example, militates against their

appearance when they arrive in Montreal. These coals are pure and fragile in their structure. They quickly disintegrate, but the process does not adversely affect their heating or commercial value to the consumer. In many respects Cape Breton coal resembles Pocahontas coal. Did our Nova Scotian coals always sell on their B.T.U.'s, they would very easily challenge competition with any United States fuel that retails in Montreal. Purchasers of coal are very human, however, and they often prefer looks to quality. One large company in Cape Breton intend to hold their trade in Upper Canada against all comers, and they are facing this problem at the present time with a view to so improving their coal handling appliances that their product will be placed on the market in the best possible physical condition.

Realizing, no doubt, that the coal industry is the most important one in the province, the General Assembly of the Legislature devoted a large proportion of the session to the consideration of matters connected with the mining law. A much-needed measure was "An Act to Consolidate the Coal Mine Regulation Act," which passed the Houses on the 16th of April. The old Coal Mines Regulation Act had been so often amended that the amendments exceeded in bulk the original enactment, and the consolidated measure renders it much easier to understand the statute. Power is given to the Commissioner of Mines to appoint a commission to enquire into the method of illumination in coal mines, and if the commission report that safety lamps are required, the Commissioner has power to order that they shall be adopted in any coal mine. The submarine mining law provides that "the Commissioner may vary or modify provisions where from the report of the Inspector it appears to his satisfaction that valuable coal areas cannot be otherwise wrought or mined." Some day Nova Scotia is going to have submarine coal mines of greater magnitude than anything that has yet been projected, and without doubt the provisions of the mining law as they relate to submarine workings will keep pace with the progress made and the experience gained. During the summer the Government employed Mr. T. E. Forster, of Newcastle-on-Tyne, to report on the submarine areas of the province. Mr. Forster is a gentleman who has had a unique experience in undersea working of coal seams and no doubt any modifications that may be made in the regulations will be based on his expert advice.

The report of the commission appointed by a previous session to enquire into the status of the colliery relief societies and the possibilities of an old age pension scheme was presented to the House. Acting upon the recommendations of this commission, an Act was passed entitled "An Act to incorporate the Nova Scotia Colliery Workers' Provident Society, and to create an Old Age Pension Board." The Act provides for the formation of a board, composed of the Commissioner of Mines and Works, who is chairman; the Provincial Treasurer, as treasurer; the Deputy Commissioner, who is secretary, and three other members, one of which number is the appointee of the coal owners, the other two being nominated by the members of the relief societies. This board takes custody of all society

branch funds in excess of \$1,000. Towards the ordinary work of relief the Government contributes a sum not to exceed 12½ cents per month per member, nor an aggregate of \$18,000 yearly. The coal owners contribute 6½ cents per month per member, and the members continue their present subscriptions. An emergency fund is to be created for the purpose of special aid in case of serious disaster, to be accumulated in the manner following.

Ten per cent. of all surplus funds is to be reserved, and a contribution of 30 cents per head per year will be made by each member, in addition to which the Government may contribute a sum of not more than \$2,000 per year. When the fund by process of yearly accretion has grown to \$50,000 it is to be available for the support of widows of deceased members. When it has grown to \$100,000 the children of deceased members are also to participate. The pension and total disability fund is to be raised by a contribution from the Government equal to that made to the ordinary relief branch, and a levy of 75 cents per annum per member on the operators. All relief afforded through the operation of the Act is exempt from lien or attachment for debt of any kind.

The Act comes into effect by proclamation of the Governor in Council, until which time the present relief societies continue as they are.

The proposals of the Government, if carried to their logical conclusion, contain the embryo of some of the sanest and therefore ultimately the most beneficial legislation that has come to our notice. The burden of providing relief and of caring for the victims and the worn-out in the industrial battle is equitably apportioned between the operators, the workmen, and the owners of the royalty—in this case the Government itself. This division avoids on the one hand the Scylla of the British Workmen's Compensation Act and its attendant millstone of old age pensions, and on the other hand it steers clear of the Charybdis of the German system of state-controlled compulsory insurance.

Unfortunately, the provisions of the Act are still in abeyance, owing, we understand, to objections urged by the miners in Cape Breton County.

At the request of the members for Cape Breton, the Government appointed a commission to enquire into the probable effect and the feasibility of an eight-hour day in Nova Scotian industries. The commission is composed of three members. Professor Magill, now of Dalhousie University, is the chairman, the two other members being Mr. Robb, of the Robb Engineering Company, Amherst, and Mr. Henry Macdonald, of Glace Bay. Following the lead of the English Commission, these gentlemen have issued preliminary questions to employers of labor, and expect to begin their sittings of enquiry early in 1909. Any proposal of an eight-hour day for coal workers will meet with the most determined and strenuous opposition from all colliery owners and operators and from large coal consumers. It is well within the mark to say that a statutory limit of eight hours to the working day in coal mines will throw the coal trade entirely into the hands of the large companies, who alone could survive the alteration in conditions. It would extinguish all the smaller companies, raise the price of coal to the consumer by 50 per cent., and would give over the St. Lawrence market to the American operators. In addition to this the large companies would be compelled to force a reduction in wages equal at least to the decrease in the working day, and serious industrial troubles would in all probability ensue.

Another matter with which the Government dealt was that of technical education, and their proposals in this connection cannot but meet with the cordial approval and support of the mining population. Provision has been made for the gradual establishment of technical schools in the large industrial centres. A Technical College is under construction at the present time in Halifax, which will eventually form the headquarters of technical education in Nova Scotia. The coal mining districts have been divided into five, in each of which an instructor is appointed, who devotes his whole time to the teaching of mining subjects, and, where necessary, local assistants are appointed to aid the instructor. Where circumstances justify the expenditure engineers' certificates required by the provincial law. At both the mining and engineering classes a certain knowledge of arithmetic and English is required. Preparatory classes are provided for those who do not possess these qualifications, and there is, therefore, no obstacle whatever in the way of the man who wishes to advance himself in the technical knowledge of his trade. The general supervision of the technical education work is given to a Director of Technical Education, an office ably filled by Prof. F. H. Sexton. An amendment to the statutes passed at the last session provides that the Council of any municipality may grant an amount for the support of a technical school, and may include this amount in their annual estimates, the money being collectable through the municipal rates in the same manner as other rates and taxes. The tuition given by the Government's classes is quite free of charge to those who comply with the rules as to attendance.

The proposals of the Government appear to have been well thought out, and so far the attendance at the classes has been as large as was anticipated for the first year. There are few places in the Dominion where technical education is more needed than in Nova Scotia, and once the young miner and steelworker realizes the value of the opportunities offered to him it is certain the work will advance rapidly. That the action of the Government was timely and necessary is evidenced by the great number of students of American correspondence schools that are to be found in Nova Scotia. The education obtained by personal tuition, aided by the actual handlink of the mechanism and objects used in everyday work, is much more valuable and lasting than that obtained through correspondence classes, and incidentally it will keep a lot of money in the province that formerly went to the United States. In making these remarks we do not wish to disparage correspondence classes. They have done invaluable pioneer work, and many men to-day owe their positions to conscientious study of correspondence lessons in their homes. It is just this class of men who will welcome and use the facilities now offered by the Government.

Of considerable interest to the coal companies who have a large export trade is an enactment of the Federal Government, which becomes effective on the 1st of January, 1909, excluding from Canadian coastal waters all vessels of foreign register under 1,500 tons gross tonnage. This law provides further for the entire exclusion of foreign ships after the expiration of a period of three years from 1st January, 1909. The order is aimed entirely at Norwegian shipping in the coastal and lake trades, and is a modification of an Order-in-Council which prohibited any foreign vessel from plying between Canadian ports after 1st January, 1909.

The proposals of the Federal Government necessarily imply a heavily subsidized shipbuilding industry for the future, as it is entirely out of the question that Nova Scotian coal companies can afford to become large owners of ships, for which during six months of each year at least they would have no employment. Mining is a sufficiently risky business without the added uncertainties of the business of the shipowner. Whether, in face of the enormous tonnage of unemployed freighters that are now lying at anchor in ports all the world over, it will pay to build special colliers in Canada within the next three years, is open to question.

The early part of the year saw a great many Boards of Conciliation appointed under the provisions of the Lemieux Act, so-called. The Provincial Workmen's Association made a general demand upon the operators for an increase in the wages of the laboring class at the mines to date from the 1st of May. The three years' agreement between the Dominion Coal Company and its workmen expired with the year 1907, and as detailed in our previous resume, the company opened up negotiations for the renewal of the old arrangement. This was refused by the men, whereupon the Coal Company issued a new schedule of wages, the principal features of which were an increase to the unskilled laboring class and to the unskilled contract coal-loaders in the mine; a decreased rate for pillar drawing, and an increase in the price of house coal to workmen. The men applied for the appointment of a Board of Conciliation, which was granted, and a satisfactory settlement was arrived at in March, which is to hold good until the 31st of December, 1909. The chairman of the Board of Conciliation was Professor Adam Shortt, a gentleman whose conspicuous abilities in the gentle art of conciliation are unfortunately no longer available. The basis of the adjustment arrived at was an increase to the ill-paid men and a decrease in the wages of the higher-paid classes. The policy which guided the Glace Bay Board seems to have been followed by all the others of later date. At Sydney Mines, Port Hood and Springhill a similarly satisfactory settlement of wages disputes was made.

Following possibly the lead of the United States operators an attempt has been made by the United Mine Workers of America to capture the organization and the funds of the Provincial Workmen's Association of Nova Scotia. The methods of the latter union, as interpreted by the Grand Officers, do not appear to have been sufficiently aggressive for some of the more fervent spirits, and attacks were made particularly on the Grand Secretary and the Grand Master, who asked to be allowed to resign. The Grand Council in session refused to allow them to do so. The question of amalgamation with the U. M. W. A. was referred to a vote of the members of the P. W. A., who were, however, so indifferent that not half of the membership visited the polls. The result of the referendum was a majority of about 500 in favor of amalgamation with the American body, but it was recognized that so indecisive a vote did not justify any change. Since that date the sympathizers of the U. M. W. A. amalgamation have entered action against the P. W. A. for a share of the Defence Fund. They also succeeded in getting an injunction forbidding the Grand Council to act in an official capacity until the action had been adjudicated upon. The injunction was later dissolved, no grounds being found for its continuance. This was followed by an action for perjury against the Grand Secretary, of the P. W. A., brought upon pretexts so flimsy that the defendant's counsel relied upon the evidence of

the prosecution to acquit his client, and did not call any witnesses for the defence. The judge dismissed the action, and expressed a strong opinion that the time of the court had been wasted. The suit of the U. M. W. A. against the Grand Council will be heard in January.

The labor supply during the season was more plentiful than for many years previous, in consequence of the industrial slackness. The loss of output due to absenteeism was not so marked as in years when the supply of labor was scanty. The increase in wages, which was given to the unskilled laborers, proved of benefit in retaining the services of these men. The cost of living, especially in the Cape Breton mining districts, remains inexcusably and oppressively high. The price of groceries is not excessive, but dairy produce, clothing and boots are sold at prices which severely tax the pockets of the miners.

It is once more a matter for congratulation that no great disaster has marked the year in our coal mines, more especially when we read of recurring mining catastrophes in other parts of the world. The accident involving the greatest loss of life occurred at Port Hood Colliery on the 7th of February, on which occasion ten men lost their lives through the contact of a naked light with an explosive mixture. The Government appointed a Commission to enquire into the accident, and as a result of the Commission's report the Government compelled the company to provide safety lamps. We hope before long to see safety lamps become compulsory in all Nova Scotian mines whether they are reputed "gassy" or non-gaseous mines.

The Rescue Station of the Dominion Coal Company was completed in the latter part of 1907 and went into full operation early in 1908. The training of rescuers has been carried on continuously throughout the year, and considerable additions were made to the equipment. The first call on the services of the station was made in September, when 22 of the Dominion Coal Company's men went to Sydney Mines and rendered valuable assistance in coping with an underground fire in the No. 1 mine of the Nova Scotia Steel and Coal Co. This company have just recently purchased twelve sets of Draeger apparatus, the same type that is used at Glace Bay, with the needful accessories, and are about to erect their own station. A project was mooted some time ago for the erection at the joint expense of the mainland collieries and the Provincial Government of a rescue station in Pictou County, but so far as we can learn, nothing further has been done. It is to be hoped that this project will not be allowed to drop.

An interesting feature of the year was the flying visit, one might almost say, meteoric visit, of the representatives of the English Institution of Mining Engineers and the Iron and Steel Institute to Nova Scotia in August. These gentlemen were the guests of the Mining Society of Nova Scotia, and, under their guidance, visited the mines of the Nova Scotia Steel Co. at Sydney Mines and those of the Dominion Coal Company at Glace Bay. They visited also the works of the Dominion Iron and Steel Co. in Sydney. A banquet was given in Sydney in honor of the visitors, which was attended by the Lieutenant-Governor and the Premier of the Province.

The most important new development of the year is the opening of new collieries by the Dominion Coal Company on their Lingan-Victoria areas. Three new collieries are projected, to be known as Nos. 12, 14, and 15 Mines. Nos. 12 and 14 are slope mines on the Victoria Seam, and are already under way. No. 15 is yet to be opened on the Lingan Seam, but the site is not as

yet definitely decided upon. The face of the deeps of No. 12 is down a distance of 1,500 feet from the entrance of the slopes, and by the summer of 1909 the mine will be sufficiently developed to produce an output of over 500 tons daily if required to do so. The bankhead is partly erected and most of the permanent colliery erections are completed. At No. 14 the face of the deeps is 500 feet down, and a temporary bankhead and boilers are erected. No permanent structures have as yet been built.

A branch railway has been constructed connecting Nos. 12 and 14 with the main line of the Sydney and Louisburg Railway. A number of the miners' houses have been built, and the sites of the towns have been graded. This new development marks a distinct stage in the coal industry of Cape Breton. Within the next five years these new mines will add possibly an additional million tons per year to the coal production of the Province.

The Hub Mine, of the Dominion Coal Company, resumed hoisting in the spring, and the improvements effected since the fire will bring the output to over 1,000 tons daily next summer.

Rumors of new mining enterprises have been more than usually rife, but nothing of any importance has taken place in this connection during the year. Messrs. Harmsworth, of "Daily Mail" fame, have bought the New Campbellton mine and areas at the entrance to the Great Bras d'Or, and are credited with the intention of mining coal for their pulp mills in Newfoundland. These areas are small and it is not likely that their operation will be a serious factor in the market.

Nothing further has been done with the abandoned property of the Broughton Company near Sydney, although the promoters have visited the property during the year.

The North Atlantic Company operating the old Gowrie property are producing about 500 tons per day, and have important developments in prospect.

The C. P. R. are credited with the intention of bonding several detached areas in the Sydney coal field, ly-

ing outside the areas of the Dominion Coal Company, and covering some of the lower and little known seams. It is extremely unlikely, however, that these areas will be touched until the exhaustion of the more profitable and easily worked seams makes it possible to work the thinner seams at a profit, and this is a day yet far distant. The present prices of coal will not permit of the profitable operation of thin or inferior seams by themselves, although they can be worked in conjunction with more valuable seams.

It is also reported that a Toronto syndicate have in contemplation the formation of a merger company to absorb the Inverness County coal trade, and take over the Inverness, Port Hood and Mabou Mines. The Inverness County outputs, with the possible exception of Mabou Mines, show a general increase.

The Maritime Coal and Railway Company, which is now operating the Chignecto Mines and has acquired the mine and railway of the Old Joggins Mine, has shown considerable enterprise during the year, and is reported to have made winnings on the Joggins Main Seam, which greatly add to the value of its areas. It would appear from the recent researches of the Geological Survey in this neighborhood that systematic search may reveal more valuable coal deposits than have hitherto been suspected between Apple River and the mines now working at Chignecto and Springhill.

At the present time the coal trade is very quiet indeed, and present indications are that the coming year will not be one that will break any records in the way of coal production. The whole world is suffering from a period of depression, and although signs are not wanting that this is moving away, it is probable that Nova Scotia will be slow to feel the improvement as she was slow to feel the depression, owing to our position on the fringe of things. In any case there is no justification for any glowing forecasts of the progress of the coal industry in 1909. Whenever the spurt is required Nova Scotia will be found more than ready, but at present it looks as if the capacity for coal production will be ample for the needs of next year.

## MAGDALEN ISLANDS AND THEIR RESOURCES.

The Magdalen Islands are situated about the middle of the Gulf of St. Lawrence, and are within the parallels of forty-seven degrees and thirty minutes and forty-seven degrees and five minutes north latitude, and between sixty-one degrees and eight minutes and sixty-two degrees and twelve minutes west longitude, and at a distance of about one hundred and fifty miles from the coast of Gaspe, sixty miles from Meat Cove, Cape Breton (the landing point of the cable, connecting the islands with the mainland), and one hundred and twenty miles from Pictou, Nova Scotia.

There are ten distinct islands in the group, now designated on all charts and in public documents under the names of Entry Island, Amherst, Dead Man's, Grindstone, Allright, Wolfe, Grosse Isle, Coffin and Bryon, and the grant also includes the Bird Islands. Four of these, namely, Entry, Dead Man's, Bryon and the Bird Islands are isolated, having no connection with each other or with the principal group. The other six islands, namely, Grosse Isle, Coffin, Allright, Wolfe, Grindstone and Amherst comprised in the Letters Patent, under the collective name of "Magdalen

Islands" are, in a way, united to each other by sand dunes. In some places lagoons of considerable extent are formed by these dunes.

The principal harbors (at which the steamer from Pictou, N.S., calls twice a week landing mails and passengers) are Amherst, House Harbor and Grand Entry.

The steamer also calls at the breawkaters at Amherst and Grindstone, and the landing places at Allright Island, Coffin Island and Etang du Nord.

Some idea may be formed of the great extent of the islands when it is considered that there is a distance of seventy miles from Amherst Harbour, the south-east extremity of these islands to East Point, the extreme north-east limit of the principal group, and that the extent of coast line is about one hundred and forty miles. Including the beaches, sand dunes and low lying tracts of land, the estimated total area is 77,980 acres.

All the islands have good roads well maintained. They offer special advantages and inducements to the farmer. The soil requires little or no manure, although no part, perhaps, of the continent of America has with-

in itself so much material suitable for fertilizing purposes.

Here the farmer can settle down on lands that for attractiveness are not easily excelled. Good crops can be grown year after year in general abundance, and the location is such that the principal markets of the Maritime Provinces are within easy access, as well as the large cities on the St. Lawrence River.

The population of the islands is about 5,000, principally of French descent. The exceptions are Entry Island, which is Scotch, and Coffin Island, which is English. The people are of good moral character, cheerful and industrious.

Joseph Bouchette, in his report to the Crown Lands Department of the Province of Quebec, has this to say respecting the history of the Magdalen Islands.

"Contemporaneous with the earliest discoveries of the River and Gulf of St. Lawrence, and of the territories adjacent thereto, may be dated the discovery of Jacques Cartier, in 1534 and 1535, and by other French navigators in the early part of the sixteenth century of that remarkable group of islands in the Gulf of St. Lawrence, collectively known as the Magdalen Islands.

"These islands, with the countries bordering on the Gulf of St. Lawrence, were subsequently involved in the various conflicts between England and France, and were the subject at different periods of treaties and conventions, transferring them from one of these sovereignties to the other, until finally by the Treaty of Peace, they were, together with all the countries known as La Nouvelle France, or Canada, Nova Scotia or Acadie, the Island of St. John (now Prince Edward Island), ceded by France to England, and in virtue of the Royal Proclamation of 7th October, 1763, annexed to the Government of Newfoundland, to which they remained attached until the Imperial Act 14, Geo. III., Chap. 33, commonly called the 'Quebec Act,' they were detached from that Province and annexed to the Province of Quebec, thereby created.

"By the Imperial Act 31, Geo. III., Chap. 33, repealing certain parts of 14th, of the same reign, and which divided the Province of Quebec into the Provinces of Lower and Upper Canada, the Magdalen Islands were attached to the County of Gaspé, agreeably to the proclamation of Sir Elured Clarke, dated 17th November, 1791, and on the division of the said County of Gaspé into the counties of Gaspé and Bonaventure, in virtue of the Provincial Act 9, Geo. III., Chap. 73, the said islands were declared to form part of the first-named county, to which they have remained attached under the Union Act already cited.

"Shortly after the cession of Canada to Great Britain, under the treaty of 1763, the Honorable the late Major Samuel Holland, being appointed (1764) by His Majesty George III., Surveyor-General of the Northern District of the British North American Provinces, received orders from the Lord Commissioner of Plantations to execute a survey of the Magdalen Islands and the adjacent islands situate in the Gulf of St. Lawrence.

"This service was assigned to Lieutenant Frederick Haldimand, by whom it was performed with great care and considerable talent.

"Agreeably to this survey of the Magdalen Islands Major Holland returned a description on the 2nd April, 1793, called for in Mr. Secretary Ryland's letter, dated 13th December, 1797, in compliance with the directions received by the Governor of this Province, from His Majesty's Ministers, to make a grant to Captain

Isaac Coffin of the Magdalen Islands as a reward for his naval services, the grant to contain, however, the usual reservation for the maintenance of the Protestant Clergy in Lower Canada required under the Imperial Statute, 31 Geo. III., Cap. 31."

In pursuance of the directions referred to the Magdalen Islands were granted by Letters Patent of the 24th of April, 1793, to Isaac Coffin, of London, then Captain of the Royal Navy, afterwards Sir Isaac Coffin, Baronet, His Majesty's Admiral of the Red.

**Topography.**—The low lands which border the sea coast present a uniform appearance, generally undulating or level. The centre of the islands are made up of numerous conical-shaped hills, some as high as 580 feet above sea level.

No rocks are observed protruding through the wall, which extends from the highest to the lowest point and every foot of land is available for cultivation.

A more agreeable seaside resort than the Magdalen Islands could not easily be found on any part of our coasts. The great extent of clean, sandy beach, backed by a deep green sward, resembling a well-kept lawn and the comparatively shallow water, considerably warmer than it generally is on the St. Lawrence, afford unrivalled bathing facilities.

These islands are not the barren, isolated spots, conceived by some, but, on the contrary, the best authorities assert that the soil of the Magdalen Islands is much richer than that of Prince Edward Island, which is considered the "Garden of the Gulf."

**Geology.**—The geological formations of these islands present great uniformity, and what may be said of one can apply with equal accuracy to the others.

In appearance they show the numerous conically-shaped hills to be made up of eruptive rocks, principally diabase and dolerite. These rocks exposed by eruptions to the atmospheric elements have disintegrated and decomposed, forming a heavy overburden of clay and loam.

This series is overlain by the Silurian Division, in which we find the Niagara and Clifton groups. This again is overlain by the Lower Carboniferous series, giving us the cherts of marine limestone and gypsum. Following upward we find the triassic formation, similar to that of Prince Edward Island, and forming almost the entire sea board of the islands.

There is very little, if any, evidence of glacial erosion, but the erosion due to local forces has been very great. But few outcrops of the limestone are found, and none of the cherts in the solid. Evidently the latter have been made up of thin layers, and are now only represented by scattered fragments.

The eruption of the basic rocks, accompanied by chemical actions, in which the metallic sulphides have been oxydized, has converted much of the carbonate of lime into sulphate of lime, which exists in large quantities on all of the islands. It is also possible that the manganese occurring here originally existed in the carbonate state, and was subsequently transformed into an oxide.

**Economical Minerals.**—The following minerals of economic value are known to exist on the islands: Manganese in the forms pyrolusite, psilomelane, manganite, and wad or bog ore. Limonite, carrying a high percentage of manganese. Gypsum in large quantities, limestone and dolomite. Clays of various colors. Ochres, red and brown. Silica sands, some showing 95 per cent. pure silica.

**Manganese.**—From the above, manganese seems to demand special attention. Here it is found in the

residual clay derived from the decay of the limestone. This clay covers a large area, and the manganese occurs in lenticular masses as oxides of various forms, but principally, as above mentioned, as pyrolusite and psilomelane, the hydrous and anhydrous peroxides. Nevertheless, there seems to be all gradations in degree of admixture, and it is often difficult to draw the line of demarcation.

Some attempt has been made to prospect this area, and numerous pits and trenches have been put in, but in no place has this work determined the extent of any body of ore. It is true that from one pit on the Quinn farm about ten tons of ore was produced, from another about three tons, and in almost all the pits ore in more or less quantities was found, yet the work was stopped and no attempt has been made to develop the area.

An analysis made by Messrs. Torrey and Eaton, New York, 1901, from ore taken from the Quinn pit gave the following results:

|                                |              |           |
|--------------------------------|--------------|-----------|
| Metallic Manganese .....       | 64.62        | per cent. |
| Oxides of Iron and Aluminum .. | 1.55         | per cent. |
| Silica. ....                   | 1.40         | per cent. |
| Moisture. ....                 | .80          | per cent. |
| Sulphur. ....                  | nil          |           |
| Phosphorus .....               | nil          |           |
| Oxygen by difference .....     | 31.63        | per cent. |
|                                | <hr/> 100.00 | per cent. |

Gypsum.—The mineral which shows the next in importance on the islands is gypsum. This is found in great variety and in large quantities, but no attempt has been made to exploit it.

## SUGGESTIONS AS TO THE USE OF CONTOURED MAPS.

By D. B. Dowling, B.Sc.

Mapmakers are always striving to give as much information on their productions as possible. With the advance of surveys the maps become more accurate, but difficulties arise when it is proposed to show the surface slopes and elevations. Hill shading is the most graphic and easiest understood, but it is apt to obscure portions where other details are to be shown. The method of showing contours is the best from an engineer's standpoint. We occasionally find, however, that even with men who are familiar with the contour map, many have great difficulty in making the mental picture of the relief implied.

For these let me suggest a simple expedient, which need not necessarily be carried past stage 2, as shown in the appended illustrations.

Mount a number of copies of the map, if printed copies are obtainable, on cardboard sheets, or trace each contour line separately on a sheet. It is not a difficult matter then to cut along one contour line on each sheet, beginning with the lowest and discarding the part that represents lower portions.

With the printed map on each piece of cardboard it is easy to fit the pieces in proper order, and you then have the map as at first, but with a rough step-like relief. When the contours have to be traced on the cardboard it is better to trace not only the line to be cut, but some of the other details above it to the next contour line.

If the cardboard can be selected from a large stock, the vertical scale can be made very nearly correct.

To illustrate, I have taken the map of the Crow's Nest coal fields reduced in Fig. 1, and mounted copies on sheets of cardboard. These when cut out along the contour lines were built up, with the result as shown in Fig. 2. The question naturally is asked, How should they be fastened in place? A wooden base should be provided and the layers of cardboard built up on it.

FIG. 1.

The best medium is carpenters' glue and a hot flatiron to press the sheets flat and remelt the glue. The centre portions of the sheet need not be glued; small-headed tacks are used, care being taken that they are to be covered by the next, succeeding sheet of cardboard.

The rough model thus obtained, as in Fig. 2, goes a long way toward showing the relief of the country, but many would prefer smoothing off these slopes. This can be done either by carving or filling the steps

with putty, clay or wax. The filling is possibly the easier, but the surface is not very permanent. I have favored carving the cardboard by using curved knives instead of carving tools. The surface thus obtained is

plane than the rest of the map. This plan is optional, but it serves as a protection. In Fig. 4 details, such as coloring and conventional signs for railways, streams, boundaries, etc., are added. The coloring representing

FIG. 2.

smooth, and will take paint or other coloring. In Fig. 2 a start has been made toward carving, but Fig. 3 is a representation of the finished surface. It will be noticed that the blank spaces on the side of the map, including the space for title, are built up to a higher

the coal measures has photographed very dark, and occupies the central part of the trough.

One advantage of a model is the ease with which sections may be shown. Cuts may be made across the model and the section painted on the edge of the cut.

## CANADIAN COPPER COMPANY.

By D. F. BROWNE.

During the last four years the converting department of the Canadian Copper Company has been in temporary quarters in one end of the furnace building. This building was designed to cover five furnaces, each 50x204 inches. Three of these furnaces were erected in 1904 and 1905, and the space designed for the other two was appropriated for four converter stands. The crane span, being but 31 feet wide, while ample for the needs of the furnaces alone, was ill adapted to the needs of the converters, and as the space occupied by

these stands was required for the erection of the two remaining furnaces, the removal of the converting department to permanent quarters was necessary. In the fall of 1907 the new converter building was started. As this building presents many features of structural and economic interest, the following description is given.

The converter building lies 80 feet to the east of and parallel with the furnace building. It is 522 feet long and 130 feet wide at its widest point. It covers

CONTOURED MAPS.—FIG. 3.

CONTOURED MAPS.—FIG. 4.

four departments, first, the quartz crushing and clay drying room, 70 feet by 60; second, the storage bins for quartz, clay and old linings, with the pugmills for crushing and mixing the lining material, which requires a space of 60 feet by 60 feet; third, the relining platform and drying stands, 112 feet long and 130 feet wide, and fourth, the converter room, with space for 10 converter stands and the necessary sculling tracks and the matte moulds, which require a stretch of 280 by 95 feet.

The building is of steel, with a uniform height of 47 feet to the roof trusses. The roof is of Bonanza tile, made of concrete and expanded metal. The sides of the converter and re-lining room are covered with corrugated iron, while the quartz crushing and pugmill department, where greater protection from the winter's cold is required, is sided with ferro inclave and cement plaster.

The plan of the building shows two matte tracks No. 17 whereon the furnace matte is transferred in 7-ton steel ladles on a transfer truck by an electric motor and cable from the furnace to the converter building. A system of signals is installed, whereby the foreman of the converter building can see at a glance just how much matte is in the settlers in the furnace

building, and can call for any desired amount of matte for the converters.

The converter room is 60 feet wide and 280 feet long, with a shed 35 feet wide on the east side. The stands are arranged along the west side at a distance of 16 feet from the wall. The converters are 23 feet 6 inches from centre to centre, except at the north end of the building, where a space of 30 feet 6 inches is left for crane repairs between the north end wall and the first stand, and also between No. 5 and No. 6 stands, where a space of 33 feet 6 inches is left for the matte transfer track and the converter flue stack.

These ten converter stands are electrically operated from two pulpits, each taking care of five stands. These pulpits are opposite the converters on the east side, one opposite the space between No. 5 and No. 6 stands, the other opposite the lower matte track at No. 10 stand. The centre line of the converters—that is, the centre of revolution—is 10 feet from the floor line. This allows the use of large ladles for matte and slag, and does away with the floor pits, which were a source of annoyance in the old building.

The converter gases are carried away by a sheet iron flue 4 feet wide and 13 feet high, which is carried on brackets behind the converters at a height of 11 feet

from the floor. This leads from both ends to a steel stack outside the building 125 feet high, 12 feet in diameter at the bottom, and 9 feet at the top. Above each converter a breeching 5 feet wide projects 5 feet from this flue. In this breeching the hood proper swings out from the top over the converter, as shown in the section. As the lines of this hood lie parallel with the edge of the converter flame, and as the gases have a clear rise of 20 feet before striking the top of the flue, all ejected sparks of matte and slag are so cooled that they do not stick to the iron work, and the former accumulations of fused masses in the hood are entirely avoided. The lower portion of the breeching is on an angle of 45 degrees, and a door here dropping on hinges allows the loose accumulation of flue dust to fall on the floor behind the converters. Doors are also provided along the bottom of the flue and in the base of the stack for the removal of this dust.

gooseneck swivel union, from which a 10 inch wrought iron pipe rises opposite the centre of rotation of the converter. This pipe rises to a height of 4½ feet above the centre of the shell is brought back by a cast iron return bend to this centre. Here it ends in a cast iron adjusting sleeve, by which the blastpipe is affixed to the trunnion of the converter shell. In order to allow the shell to be raised or lowered on the stand without striking the blastpipe this latter swings on the gooseneck as a centre, its motion being controlled by a screw which is fastened to an upright I beam. The rise of the blastpipe above the trunnion serves to prevent the matte surging back into the blastpipe in event of any accident to the blowing engine or to the electric motors. Below each of the Dyblie valves on the wind box a fusible plug is provided for the same purpose. In the old building one or two occasions a lightning flash threw off both the current and the blast at

LEGEND.—Fig. 1—General Plan. Fig. 2—Section through Pug Mill and Bin Department. Fig. 3—Section through Converter Room. Fig. 4—Section through Relining Department.

1—Furnace Building. 2—Converter Room. 3—Relining Department. 4—Pug Mill and Bin Department. 5—Crushing and Drying Department. 6—Slag Casting Machine. 7—Slag Bin. 8 and 9—Pulpits. 10—Relining Platform. 11—Wood Platforms. 12—Relining Tracks. 13—Wood Tracks. 14—Quartz Track. 15—Clay Track. 16—Sculing Tracks. 17—Matte Transfer Tracks. 18—Furnace Charge Tracks. 19—Converter Stands. 20—Converter Stack. 21—Shell Drying Stacks. 22—Casting Moulds. 23—Lining Bins. 24—Pug Mills. 25—Converter Flues. 26—Travelling Crane. 27—Jib Crane. 28—Converter Slag Tracks. 29—Escalator.

The converter blastpipe, 3 feet in diameter, is carried on steel trestlework at a height of 19 feet across the yard from the substation to the southeast corner of the converter building, where it turns at right angles and is carried at the same height under the shed roof behind the pulpits. At each pulpit a 24 inch branch is led off to a manifold in the base of the pulpit, from which five 12 inch cast iron pipes are led underground, one to each of the five converters operated by this pulpit. The stem of the quick-opening gate valve in each pipe is brought up through the floor of the pulpit and ends in a rack which engages a pinion on the shaft of a sprocket wheel. The chain of this sprocket wheel passes round a controlling hand wheel at the front of the pulpit. Two turns of this hand wheel raises or lowers the gate valve in the blastpipe below. At the converter this cast iron pipe ends in a

the same time, and the sudden rush of matte into the wind box plugged up the blastpipe. The new arrangement prevents this accident. The wind box also is situated above the tuyeres, the latter being connected individually to its under side. This arrangement also tends to prevent any matte getting into the wind box.

The motion of the converter is controlled by a 30 h.p. induction motor directly connected to a worm gear. The wires for each converter are led in ducts from the pulpits. An electric button on the wall opposite each converter actuates a bell and annunciator in the pulpit, so that no mistake can be made as to which converter is to be turned up or down.

The tread ring on these converters is continuous, so that the shells can be completely revolved on the stands. This does away with the possibility of breaking the wind box and also allows the blast to be deliv-

ered at any desired angle under the matte. Hence there is much less sloppage of the charge and less converter scrap to be rehandled in the furnace.

The furnace matte is tapped from the settlers in the furnace building into steel pots protected by a thin clay lining of slag. It is lifted by the crane and set on one of the transfer cars, which are hauled across to the converter building by an electric motor and cable. In the converter building two Morgan electric cranes handle the matte to and from the converters and the shells to and from the lining stands. These cranes have 50 ton main and 20 ton auxiliary hoists. The crane span is 55 feet 8 inches from centre to centre of the rails, and the lowest point on the crane is 35 feet from the floor. The crane travel is 200 feet per minute, and the speed of the main hoist is 18 feet, and of the auxiliary is 36 feet per minute.

The converter slag is poured into pots, which are hauled to the slag casting machine by a light locomotive. The slag cars carry 5,000 lbs. apiece. The slag casting machine is at the north end of the converter building, and 50 feet therefrom. It was built from the designs of the Tacoma Smelting Company, with some minor changes. It consists of two circular angle iron rings 59 feet inside and 66 feet outside diameter, supported on axles four feet apart and rotating on a circular track. In the annular space between the inner and outer circles rest 144 cast iron moulds, each overlapping the next. This ring rotates in 10 minutes, and the moulds will hold approximately 10 tons of slag. The moulds are automatically dumped into one of two skips, in which a spray of water is played. These skips are raised by an electric hoist on an inclined track and dumped into a steel bin, from which the slag is discharged into the furnace charge cars as desired.

When a shell is burnt out it is lifted from the stand and placed on a sculling car, and the top is lifted off. Four sculling tracks are laid at right angles to the building and run from the outside edge of the shed twelve feet under the crane span. In the shed are provided platforms the height of a flat car floor. The sculling cars are hauled out by a cable and motor to these platforms, the lining is cooled, and the adhering slag and any loose lining broken out and thrown on these platforms. The cars are now run back and the shell lifted to the relining cars beside the relining platform.

The relining platform is 112 feet long, 20 feet wide and 10 feet high. It projects down the centre of the crane runway above the lining tracks, which pass underneath at right angles to the platform. Six tracks thus allow 12 shells to be under lining at one time, six at each side of the platform. The platform itself is of steel, with a concrete floor, and carries two 24 inch tracks, on which the lining material is trammed from the pugmills to the shells.

The shells to be relined are set down by the crane on cars on either side of the relining platform. The top of the lower section of the converter shell comes flush with the top of the platform and about 18 inches away from it. A sheet iron apron is laid between the edge of the platform and the shell to prevent the lining material from falling on the tracks below. The material for lining the shells is wheeled from the pugmills in small steel cars with a swinging body and end dump, so that the lining is piled on the floor near the edge of the platform. This is shovelled by one man into the shell, where two men guide the ramming ma-

chine. After the bottom of the shell has been levelled up to two inches below the tuyeres the centre mould is put in position and the lining carried on up to the top of the shell.

The ramming machines are made in the company's shops, and consist of a somewhat modified rock drill mechanism, without the feed screw and rifle bore. The cylinder has a heavy cast iron jacket. The whole machine weighs 525 lbs. This extra weight absorbs the shock of the stroke, and prevents the machine from dancing. The machine is hung from a jib crane by a trolley chain block. This gives free motion horizontally and a quick and positive vertical adjustment.

After the bottom is finished the tops, which have been lined on a separate car and partially dried, are put on the shells, the joint being made tight by a layer of soft clay and quartz mixture, which the weight of the top squeezes out into all the crevices. The lining cars are now moved out under the drying hood and beside the wood platform.

The cordwood for drying the converters is brought in on flat cars under the shed roofs at both sides of the relining department. The wood is thrown on two platforms 12 feet wide and 10 feet high. These platforms serve to hold several days' supply of wood.

The converters come directly under hoods 16 feet apart, which hoods open into two flues 4 feet wide and 5 feet high. These flues lead to two stacks 5 feet in diameter and 75 feet high, which carry off the wood smoke during the drying of the shells. The tuyeres of the converters are pricked through the lining when the centre mould is in position, and also during the drying operation.

After 15 hours' firing the converters are moved back under the crane runway and placed on the stands. Here they are turned down and the tuyeres pricked out again, and the hood is swung out by the crane and locked in position.

With a new shell the first tap is small, about 1 to 1½ tons. This is blown about 20 minutes, and the slag is skimmed. The second tap 1½ to 2 tons is put in on top of the charge and the blow continued about half an hour, when the slag is skimmed again. The third tap about 3 or 3½ tons is now put in and blown for half an hour, skimmed and blown again till all the slag is "up," which means that the iron is practically oxidized. This last slag is skimmed, and the finishing blow of about 10 minutes is given. This granulates the slag so that it remains behind in the converter. The matte is now cast, and this ends the first blow.

The second blow starts with about 3 tons of furnace matte, which is blown about 50 minutes, then slag is skimmed and another tap of 3½ tons is put in and blown say 50 minutes, skimmed, blown again about 25 or 30 minutes till the slag is up, and then blown 10 minutes to finish after the slag is skimmed. The matte is now cast.

The third blow starts with a full ladle of about 6 tons. This is skimmed twice and blown to a finish.

The fourth blow is the same as the third, using a full ladle of 6 or 7 tons of furnace matte.

One lining will average about 4 casts, 8 taps, and 7 hours blowing time, producing about 6½ tons of Bessemer matte, according to the grade of matte from the furnace.

One lining requires about 4 tons clay and 8 tons quartz. This clay includes all supplied to the furnaces for matte chutes and budding clay, which comes back ultimately to the old lining bin. The quartz carries

about 93 per cent. silica, with no copper or precious metals, while the clay is a local silt containing about 60 per cent. silica. The Bessemer matte contains 80 to 81 per cent. copper nickel, 16 to 17 per cent. sulphur, and  $\frac{1}{2}$  to 1 per cent. iron, the balance being oxygen and a small amount of converter slag. This matte is poured by the crane into stationary ladles, which stand on concrete piles at the north east corner of the converter building. A hole in the side of these ladles close to the bottom allows the matte to flow out through clay-lined chutes into cast iron moulds. These moulds are sectional, each section being 2 feet by 5 feet, with a lip or edge 4 inches high. Twelve of these bolted together form a continuous mould, holding about 3 tons of matte.

When this is cold it is pried up by crowbars on one edge and pipe rollers are slid underneath. The cake of matte is now easily rolled out on a cast iron floor, broken, loaded into barrows and weighed. The barrows are wheeled to an escalator behind No. 1 pulpit, which carries them to a platform level with the matte car floor.

The quartz and clay bins lie immediately behind the relining platform, as shown in the plan. The bins are of  $\frac{3}{8}$  inch plate, and of the suspended catenary type. These are in two rows, one on the east, the other on the west side of the building. Each row is really one continuous bin, with vertical plate partitions. The total length of each row is 60 feet, and the depth 22 feet. These are subdivided so as to form on each side one large bin for quartz and two small bins, one for clay and one for old linings. The bins will hold 800 tons of quartz in all, and about 500 tons of clay.

There are 8 chutes under each bin row. These chutes are directly over 24 inch tracks, on which run small plate iron end dump cars. These cars shuttle back and forth under the bins and bring the quartz and clay to the pug mills. The concrete platform on which these cars run is 5 feet above the platform on which stand the pug mills. In this way the material can be dumped directly from the bin cars into the mills, while the mill plows can throw the mixed material into similar cars on the lower platform, thus avoiding any shovelling.

At present the pugmills are as follows: One 6 foot under-drive Allis-Chambers mill, belt driven, by a 30 h.p. induction motor; one 6 foot heavy type Power

and Mining Machinery Co.'s mill, over-drive, belt-driven, by 30 h.p. induction motor; one 7 foot over-drive Carlin mill, belt-driven, by a 35 h.p. motor.

All the motors for these mills are lodged in a dust-proof room overhead, but all the controllers are arranged beside each mill. Space is provided for the addition of three more mills as they may be required.

The quartz crushers, clay driers and elevators are directly behind the bins at the south end of the building. The quartz comes in on a track parallel with the west side, and the clay on a track parallel with the east side of this department. Both are unloaded on platforms as high as the car floor.

The quartz is shovelled into a Gates crusher No. 4 K, which has a capacity of 10 or 12 tons per hour crushed to  $1\frac{1}{2}$  inch size. This crushed quartz falls into an elevator boot, from which it is lifted to a screen 10 feet long, with  $\frac{3}{4}$  inch holes. The fines from this slide directly into an elevator boot, while the coarse passes through an Allis-Chambers 30x14 roughing rolls, crushing to  $\frac{3}{4}$  inch, and then drops to the elevator. The quartz is now hoisted to a distributing chute 47 feet from the floor. A system of gates in this allows it to fall through chutes on either belt and drop into any bin desired.

The distributing belts are 14 inch rubber-faced, and convey the material at an incline of 20 degrees. Stationary trippers are provided at each bin, so that the material can pass over any bin or drop at any point required.

The clay is unloaded on a platform, and in the summer wheeled directly up an incline and dumped on the concrete floor behind the pug mills. In the fall and winter, however, when it comes in frozen in lumps, it is passed through a Jeffrey coke sizer and then shovelled into the clay drier. This is built by Ruggles-Coles, and has a capacity of about 4 tons per hour, and is 30 feet long and 70 inches diameter.

The flame from the firebox passes down a central pipe and then back through the annular space in which the clay rotates. The machine both dries the clay and rolls it into pellets before it is delivered to an elevator and passes to the distributing belts.

The clay drier is driven by a 15 h.p. motor, and the quartz crusher rolls and elevators by a 66 h.p. motor. These are housed in a room on the same floor as the pug mill motors.

## FIELD WORK OF THE GEOLOGICAL SURVEY OF CANADA.

The distribution of the parties was as follows:—

### Yukon and Mackenzie.

Mr. D. D. Cairnes, assisted by Dr. O. Stutzer, was engaged in the Tantalus district, near White Horse, defining the coal area, with the object of determining the character of the coal and discovering the point nearest transportation where a commercial supply exists. Mr. Matheson had charge of the topographical work in connection with this investigation.

Mr. V. Stefansson descended the Mackenzie, and will winter with the Eskimo in the Arctic. The expedition, which is sent out by the American Museum of Natural History and the Geological Survey conjointly, while primarily for ethnological purposes, is expected

to add to the geographical knowledge of the Arctic coast. In addition, an endeavor will be made to obtain information regarding mineral occurrences. Mr. Stefansson took with him a set of ore specimens to assist him in eliciting information as to ore occurrences from the natives, who are good observers in this respect.

Mr. Joseph Keele, who wintered on the divide at the head of the Pelly River, continued his exploration across to the Gravel River, and descended this stream to the Mackenzie.

### British Columbia.

Mr. R. G. McConnell spent the season on Texada Island prosecuting a somewhat detailed geological survey of the northern part of the island. The copper and

iron deposits here are attracting attention, and it was in response to an urgent appeal for a geological survey of the island that this work was undertaken. Mr. F. Maclaren was engaged in a topographical survey of the same field as a foundation for the geological map.

Mr. R. Graham continued the survey of the Pacific coast and inlets begun in 1906 by Mr. Leroy and continued in 1907 by Mr. Bancroft. The work this season was the section between Kingscome Inlet and Bella Coola.

Mr. W. W. Leach continued his explorations in the Bulkley Valley near the route of the Grand Trunk Pacific. Coal, copper and lead prospects and the advent of transportation facilities make this field of importance.

Mr. C. H. Clapp, assisted by Mr. Kenneth Chipman, commenced a survey of Vancouver Island.

Some work had been done by the Survey in the Nanaimo coal areas in the 70's. The northern end of the island was studied by Dr. Dawson in 1886, and a few of the inlets of the west coast in 1902, but for the most part the geology and topography of the island is unknown to the Survey. From an agricultural as well as from the mining standpoint the island is rapidly increasing in importance, and it was decided to begin its systematic survey. Mr. Clapp made the start at the southern end of the island as affording the most favorable opportunities for geological investigation.

Mr. John Macoun, assisted by Mr. W. Spreadborough, naturalist to the Survey, was engaged making a representative collection of the fauna and flora of the island for the new museum. Mr. C. Roberts, one of the preparators of the Survey, was stationed at Nanaimo, mounting the fresh specimens.

Mr. Macoun was also instructed to visit the Rossland mines for the purpose of studying the fungi, whose growth in mine timbers causes their rapid destruction, entailing a heavy expense upon the mines. The object of this investigation was to discover, if possible, a commercial method of preventing their growth. On a later page will be found an account of a cheap method of preserving the timbers kindly furnished me by Mr. Watson, of the visiting British engineers, with whom I discussed the problem.

Mr. Charles Camsell completed his detailed study of the Hedley mining camp, and began a survey of the Tulameen district. The latter is unique in that it is the only district in Canada where platinum gravels have been worked on a commercial scale. Railway facilities for this section are projected, and with the solution of the transportation problem it is expected that this portion of the country will receive active development. The present work is in anticipation of this.

Mr. L. Reinecke was engaged in the topographical surveying of the districts examined by Mr. Camsell.

Mr. W. H. Boyd was employed on a detailed survey of the Phoenix camp. At the close of the season he made a hasty examination of the Slocan district to plan for its survey next season.

Mr. O. E. LeRoy made a detailed investigation of the Phoenix camp and its ore deposits. After finishing this he spent a month on the underground geology near Sandon.

#### Alberta.

Mr. George Malloch made a geological and topographical survey of the Bighorn coal area on the Brazeau River. Coal in quantity and of exceptional quality is found here.

#### Alberta and Saskatchewan.

Mr. Dowling was engaged in investigating the coal supply of various portions of Saskatchewan and Alberta.

#### Saskatchewan and Keewatin.

Mr. W. McInnes spent the season on surveys from Lac la Ronge down the Churchill to South Indian Lake. The prospect of a railway to Hudson Bay has created a demand for information concerning this north country and its mineral possibilities. The Survey had no information concerning this section of the Churchill, although the upper and lower portions had been explored. To fill the gap this work was undertaken. Reported discoveries of valuable minerals at Lac la Ronge made exploration of that region important.

#### Keewatin.

Mr. Owen O'Sullivan completed the instrumental survey of the shores of Hudson Bay. A section of 250 miles remained undone, and as so much interest now centres round Hudson Bay, it was deemed advisable to complete its survey.

#### Ontario.

Mr. A. W. G. Wilson spent the field season about Lake Nipigon, completing the geological work necessary for the map of this region, which the National Transcontinental will open up.

Mr. W. H. Collins made a geological examination of the upper part of the Montreal River. The lower portion of this river received much attention from prospectors last year, and it was hoped that geological information would be secured regarding the upper country before it would be required by the advancing prospectors.

Mr. W. A. Johnson continued work on his Simcoe sheet in Southern Ontario.

Mr. F. B. Taylor and Mr. Goldthwaite, who have been for some years working on the superficial geology and the history of the Great Lakes region for the United States Geological Survey and for State Surveys, extended their studies into Ontario, under the auspices of the Geological Survey of Canada. Mr. W. A. Johnson co-operated with them in this work.

Mr. E. D. Ingall spent his field season in the gas and oil region of Southern Ontario, obtaining information for a new map of the productive districts.

#### Quebec.

Mr. M. E. Wilson, who had been studying the country east of Lake Temiskaming during the past two seasons, was this year engaged in extending this work northward in Quebec. Considerable prospecting is being done in this region east of Larder Lake on the Quebec side of the interprovincial line.

Mr. W. H. Boyd, with a party of topographers, spent a few weeks on a map of St. Bruno Mountain, required for Mr. Dresser's report on the geology of this old volcano.

Mr. J. A. Dresser in the early spring examined the recent gold discoveries in Megantic, and issued a preliminary report on this field. Mr. E. R. Faribault also visited this district and contributed a sketch map for the report. Mr. Dresser's main field work was along the National Transcontinental Railway in Eastern Quebec, which will open up a district about which the Survey could furnish but meagre information to the numerous enquirers.

Mr. R. W. Ells investigated and reported on the landslide at Notre Dame de la Salette.

Mr. W. McInnes, and later Mr. H. M. Ami, made brief visits to Bergeronnes, on the Lower St. Lawrence, to examine the condition of the clay banks in its vicinity, as the inhabitants were in some apprehension of slides.

#### New Brunswick.

Mr. G. A. Young was occupied during the field season in a detailed survey of the Bathurst district. The iron ores of this district are receiving attention, and the Survey had been petitioned to make a detailed study of the local geology.

Mr. R. W. Ells was commissioned to go to Scotland to report on the important oil shale industry of that country, and on his return to examine the Albert shales of New Brunswick with a view to determining their possibilities as a basis for a similar industry in this province.

Mr. L. Lambe, vertebrate palaeontologist, was engaged in collecting Devonian vertebrates in New Brunswick and Nova Scotia, chiefly in Albert County, N.B., and Kings County, N.S., to secure palaeontological evidence regarding the geological ages of the formations believed to be or which might possibly be Devonian. In the Maritime Provinces, where economic materials such as coal occur in definite geological horizons, such work is of great economic value.

Mr. W. J. Wilson made collections along the Bay of Fundy, paying special attention to plant remains.

#### Nova Scotia.

Mr. Hugh Fletcher continued work on the map sheets of parts of Cumberland, Kings and Annapolis Counties. Geological work in this section is of extreme importance on account of questions as to the continuity of the coal measures.

Mr. E. R. Faribault was also engaged in extending the surveys on his map sheets in Lunenburg County and Kings County, covered by the Gaspereau River, New Ross and Chester Basin sheets.

Mr. H. M. Ami spent a portion of the summer in Antigonish to determine the horizon of carboniferous rocks near Big Marsh, which the Survey had mapped as lower carboniferous. The presence of bituminous shales (which in places pass into coal) in these rocks had led a number of local people to hope that the rocks

would be found to belong to the coal measures. Mr. Ami also collected fossils from several Nova Scotia localities.

#### Prince Edward Island.

The work of the Survey in Prince Edward Island took the form of deep boring operations to determine the depth at which the coal measures occur, and, if possible, to prove the presence or absence of coal seams within working distance from the surface.

Outside his office duties, Mr. Brock spent a few days at Cobalt, made two visits to Prince Edward Island in connection with the boring operations, made an official trip with the Minister of Mines through Southern British Columbia, accompanied the mining engineers throughout the western portion of their excursion, visited several of the field parties at work in British Columbia, and spent some weeks in the Slocan, the Sheep Creek gold district south of Nelson, and in Rossland.

The growing interest in and use made of the work of the Survey is shown by the increasing demand for Survey publications. Over twice as many publications were asked for and distributed the past year as were called for the year before; many reprints have to be made of the more valuable reports, and a large increase made in the regular editions of Survey reports.

A topographical division of the Survey is being organized under the supervision of a topographer.

A well records division has been organized to collect, preserve and publish the information to be gained from boring operations throughout the country. Very valuable geological information, bearing on the stratigraphy, and on problems connected with oil, gas, salt, water, etc., is to be obtained from such borings, and it is of the highest importance to both scientists and practical operators that such information be preserved and rendered available. Sample bags, log books, etc., are sent to them to be filled, and these can be mailed to the Survey free of charge. Everything will be done to make their part of the work as little burdensome as possible. With the active assistance in this matter of the drillers, who stand to gain most benefit from this work, this division should become one of the most useful parts of the Survey organization.

## TECHNICAL EDUCATION IN NOVA SCOTIA IN 1908.

By Director F. H. Sexton.

The year that has just been brought to a close has seen the successful termination of the first year of the system of evening technical schools under the new Department of Technical Education, beside the opening of these schools on their second year and the construction of the Nova Scotia Technical College in Halifax.

A cut of the college, as it stands to-day, is included in this brief article. The outside of this 150 x 90 building is completed, except for the main entrance, and the pillars on each side, and the central pediment above the pillars, on which the name of the college is inscribed. This building will contain the lecture rooms, assembly hall, scientific laboratories, Provincial Science Library, the Provincial Museum, and administration offices. The workshops, power and heating station, hydraulic laboratory, mining, and metallurgical laboratory and mechanical and electrical engineering laboratory will be in buildings of factory type, separate

from the main college building. The college structure is of Nova Scotia red pressed brick with Wallace freestone facings. It has a steel frame and is of slow-burning reinforced concrete construction. The interior is now being finished and will be ready for occupancy by the end of May.

The Technical College is in a strong affiliation with all of the Nova Scotia colleges, four in number, and with Mount Allison University in New Brunswick. The Governing Board of the college is composed of one representative from each of the affiliated colleges, together with the Director of Technical Education.

At a meeting in June, the Governing Board adopted a uniform two-years course to be carried out in the affiliated colleges, and to be recognized as the first half of a four years engineering training. This two-year work contains the general mathematics, science, language, drawing, work-shop, etc., that can be easily car-

ried out by the affiliated colleges, without much additional staff or equipment over what they possess at present. The last two years of professional work in engineering are to be carried out in the Technical College, thus avoiding duplication of effort and equipment in all the colleges, if each attempted to carry out the full work for degrees in engineering. Equipment and instruction in the Technical College will be provided for the basal departments of civil, mechanical, electrical and mining engineering. Short courses will be provided in mining for colliery managers, in civil engineering for road inspectors, in mechanical engineering for firemen and steam engineers, etc. These short courses are necessary, in order to serve the province with the educational needs that are so apparent in the industrial circles.

In establishing a system of technical education, the government in Nova Scotia realized that they had to provide for both the youths that were about to become wage-earners and also those who were already engaged in the industries. The government thought that their

for a knowledge of electricity and for the ability to read working drawings. Steam engineers, who are most capable in their own line, see some electrical machine introduced suddenly into the plant over which they have supervision, and are more or less at sea because they have not had any fair chance to learn the principles and modes of operation of dynamo-electric machinery. To make the teaching in this subject effective, considerable electrical apparatus and a number of motors, dynamos, etc., were purchased and a laboratory started in each place so that the men may work with the actual machines, in addition to class-room work.

The coal mining schools aim to instruct miners in the science and art and modern practice in this difficult branch of industry. There is an evening school in practically every colliery town in Nova Scotia—some twenty in all. Day classes are held in the larger towns for men who work on night shift. The teachers, with the exception of a few assistants, are men who are best fitted by training and long practical experience to act

first duty was to raise the skill, efficiency, and productive capacity of those already in the trades as much as can be done by education instead of training more men for the trades. Therefore, they started a comprehensive system of evening schools.

The evening technical schools under the direction of the Department are of three distinct classes: Engineering Schools, Coal Mining Schools, and Technical Schools. The first two kinds are confined to the colliery districts and the last mentioned to manufacturing centres.

Engineering schools are maintained in the large centres and instruct firemen, engineers, and mechanics in the elementary scientific principles and modern practice in steam and mechanical engineering. This year classes in mechanical drawing, machine drawing, electricity and dynamo-electric laboratory have been established in connection with the engineering schools, and have been very well patronized. Men working about power plants find every year more and more necessity

as instructors. Every one had several years of underground experience of varied character and had risen to some position of responsibility. Each instructor gives his whole time to teaching, holding classes two nights a week in each of three places in his district, and holding day classes wherever there is a large enough number of students to warrant it. Assistant instructors from the colliery officials who work in the day time are appointed to hold classes in the smaller places more remote of access.

To enter the coal mining classes, as well as the engineering classes, the student must by examination prove that he is proficient in arithmetic through fractions and decimals, and that he possesses a good working knowledge of English composition. In coal mining towns, however, there is more than the usual tendency for boys to leave school just as soon as he is allowed by statute. Because of neglect or limitation of earlier educational opportunity, many older men, desiring a greater knowledge of the underlying principles of ven-

tilation, mechanics, modes of work, etc., find they have no basis upon which to advance to the desired goal. For this reason preparatory evening classes in arithmetic and English are carried on in every locality where the more technical classes are held. In the larger centres these are divided and graded in two, three or four sections according to the number of pupils. A number of men attend these more elementary classes who merely wish to improve their general education, which was of very limited extent when they were young. In some of the smaller sections where the evening schools are of the most benefit and hard to maintain on account of the small number of students, the public school trustees are anything but generous in their attitude toward the provincial government which bears the total expense, while most of the larger towns co-operate generously.

The attendance at the coal mining schools is large and the students are in earnest. Some of the mathematics in connection with theory of ventilation and machines is very difficult, and it is wonderful what great assiduity is displayed and the remarkable grasp of the subjects attained by some of the students who cannot work ordinary fractions when they begin in the schools. Most of the Nova Scotia coal miners are native born, are most intelligent and work under the best of conditions. The hours of labor are comparatively short for most of the men, and the evening instruction is not the tax on their powers that it is on men who do not have time for a good rest between the time they stop work and the time they go to school. There is no doubt but that the general diffusion of the knowledge of the principles underlying the processes employed in the mining of coal will do much to make a more intelligent, alert, responsible miner and will be a great safeguard against such disastrous catastrophes as are becoming alarmingly common in the United States of late. So far as the author knows this is the only local government (Provincial or State) in America that has a system of secondary mining education, generally applied over the whole domain.

The last kind of evening school is the evening technical school established in the various larger manufacturing centres. There are at present four of these, viz., Halifax, Amherst, New Glasgow, and Sydney. In each place they are conducted in the public school buildings. The Provincial Government bears practically all the expense of the coal mining and engineering schools, but in the evening technical schools provides one-half the cost of instruction and furnishes the necessary apparatus, while the locality is required to supply the other half of the cost of instruction, besides the rooms, heat, light and janitor attendance.

Such courses are given as will teach the men in different vocations the drawing, science and modern practice connected with those vocations. The number and kind of courses offered in any locality depend on the number of students available and the dominant industries. There are some classes, such as Practical Mathematics, Mechanical Drawing, and Electricity, etc., that are demanded in every centre, and then there are others, such as Metallurgical, Chemistry, Pharmacy, etc., that are dependent on the size of the locality and the special industries.

These classes are not entirely free. An experiment was tried on the establishment of the schools to attempt to insure a constant attendance. During the first four sessions of any class, the student is required to make a deposit of \$2.00 to \$4.00, depending on the

class. This deposit is kept until the end of the year, when it is refunded according to the attendance. The refund is made on the following basis:

- 100 per cent. attendance—whole deposit returned.
- 90 to 99 per cent. attendance—four-fifths deposit returned.
- 80 to 90 per cent. attendance—two-thirds deposit returned.
- 70 to 80 per cent. attendance—one-half deposit returned.
- 60 to 70 per cent. attendance—two-fifths deposit returned.
- Below 60 per cent. attendance—none of the deposit is returned.

It was feared on one hand that the deposit might keep some students away, and on the other hand that it was not large enough to act as a strong incentive to attend regularly. Both fears were proven to be groundless.

The attendance was remarkably constant, in some classes averaging 84 per cent. for the whole year. Many students also received the whole deposit back for 100 per cent. attendance.

The courses offered in these schools are as follows:

- Practical Arithmetic.
- Business English.
- Practical Algebra, Geometry and Trigonometry.
- Mechanical Drawing.
- Machine Drawing.
- Machine Design.
- Architectural Drawing.
- Building Construction.
- Architectural Design and Estimating.
- Elements of Electricity.
- Elements of Electrical Engineering.
- Power Plants and Electrical Transmission.
- Electrical Laboratory.
- Electrical Engineering.
- Elements of Chemistry.
- Technical Chemical Analysis.
- Elements of Surveying.
- Surveying and Plotting.
- Elements of Civil Engineering.
- Pharmaceutical Chemistry and Pharmacy.

It was found necessary after the first year's experience to supplement the recitations and class lectures with laboratory method, especially in electricity. The practical men in the classes needed concrete illustrations even more than ordinary school pupils. About \$10,000 was expended in the purchase of electrical apparatus, machines, and measuring instruments, and a small dynamo-electric laboratory started in connection with each of the four schools.

The different technical subjects are now so arranged that each may be followed for three years in successively advancing classes. By obtaining a pass-mark of 75 in each of the three classes, and the same standing in the general subjects of Practical English, Practical Arithmetic, Algebra and Trigonometry, Practical Geometry, the student is entitled to a full diploma, the highest honor in the schools at present. A diploma would be given, for example, for satisfactorily passing the following group: Practical English, Practical Arithmetic, Practical Geometry, Algebra, Trigonometry, Mechanical Drawing, Machine Drawing, and Machine Design.

To make these classes a success the department has been forced to supply the classes with all draughting

supplies at reasonable prices, owing to the fact that most of the classes are situated in places where these supplies are not at all available. The text-books of most of the subjects taught, were found to be far from suitable, and the department has been compelled to start publishing texts for its own peculiar needs. So far the only one issued has been a book on "Practical English," but a course in Mechanical Drawing and another book on "Mathematics for Coal Miners" are in preparation.

The total numbers registered in the different schools last year are as follows:

|                                 |       |
|---------------------------------|-------|
| Engineer Schools .....          | 231   |
| Coal Mining Schools .....       | 649   |
| Evening Technical Schools ..... | 429   |
|                                 | <hr/> |
|                                 | 1,309 |

The numbers this year have not increased as much

as was expected, because the opening of the schools was much hampered by the intense political excitement that prevailed this autumn, especially in the industrial centres.

An evening Technical School for Fishermen, carried on in connection with the Dominion Department of Marine and Fisheries, is to be opened soon after the first year of the year. A movement on foot that is meeting with universal commendation so far is to establish at Halifax a day and evening trade school for women and girls. In it will be taught courses in millinery, dress-making and domestic economy. It will aim to train thoroughly those women, that have to resort to gainful occupations from necessity, for trades and domestic necessity.

The work of technical training in Nova Scotia is moving slowly, sanely, and surely, backed by a sturdy intelligent people, who have a reputation for possessing both desire and reverence for all education.

## THE REPORT OF THE GERMAN DEVELOPMENT COMPANY, LIMITED.\*

### I.

1907.

**Report on Mining Claims in the Montreal River Mining Division, by Alfred E. Barlow, M.A., D.Sc.**—In August, 1906, Dr. Barlow first directed the attention of his principals to the Rabbit and Ko Ko Ko Lake areas. Diligent prospecting brought only negative results. A short campaign in the vicinity of Maple Mountain was also fruitless. The lateness of the season then rendered it imperative that a concession near Makamik Lake, in the Province of Quebec, be examined before snow fell. No veins worth staking were encountered here.

During the winter of 1906-07 an expedition under Mr. Albert Scott was sent out to explore the country in the vicinity of the Transcontinental Railway between Abitibi Lake and Bell River. Despite glowing accounts that had been received concerning the commercial possibilities of this region, especially regarding timber and pulpwood, Mr. Scott's report indicated nothing to justify the investment of capital.

Late in the summer of 1906 persistent rumors were current to the effect that cobalt, nickel, and silver had been found near the Montreal River, in the neighborhood of Maple Mountain and James Township. Throughout the winter promiscuous staking went on. For miles in and about James Township territory was staked. Most of the claims were recorded without discovery. Consequently over 90 per cent. of the claims thus staked were thrown out by the Government inspectors, only to be re-staked and recorded again. Dr. Barlow estimates that at the beginning of June, 1907, there were more than 3,000 prospectors working in the country drained by the Montreal River and its tributaries, a territory including parts of the Townships of James, Smythe, Tudhope, Mickle, and Farr, covering an area of 40 square miles. The centre of the area is about 35 miles northwest of Cobalt.

During 1907 the land, or winter, route started from Earlton, on the T. & N. O. Railway, crossing the northern parts of the Townships of Armstrong, Beauchamp,

Bryce, and Tudhope, to Elk Lake, opposite the mouth of Bear River, in the fifth concession of James Township. Seven miles of this 30 mile trail had then been converted into a wagon road. The water route from Latchford to Bear River, 50 miles, broken by three rapids, was traversed by two lines of steamboats. The stages of the journey, which was then completed in not less than 12 hours, are:—

Latchford to Pork Rapids, 9 miles.  
Pork Rapids to Flat Rapids, 27 miles.  
Flat Rapids to Mountain Chute, 3 miles.  
Mountain Chute to Bear River, 11 miles.

Physically, the district presents an uneven rocky surface, with intervening valleys occupied by swamps and lakes. Only low hills vary the scenery. Outcrops of rock are frequent on the higher ground, but much of the area is drift covered.

All of the ore bodies in the district occur as veins cutting a quartz-diorite or gabbro. Most of the veins occupy two sets of fissures running approximately north and south and east and west, respectively. The fissures are regarded as contraction cracks formed by the cooling laccolith and filled by later and more acid secretions of the same magma from which the accompanying diorite has solidified.

"The vein-filling must therefore be regarded as of pegmatitic origin, having the same genetic relationship to diorite that ordinary pegmatite does to granite. For purposes of discussion and correlation it may therefore be referred to as diorite-pegmatite in preference to the term "Aplite" by which the material in these veins or dikes is now known to the prospectors of the Montreal River district, for the latter would imply the formation of this material as a differentiation product of granite. As a rule these veins are more or less irregular, often curving, sometimes faulted, but surprisingly persistent over long distances. The fissures which they occupy vary from a fraction of an inch or a mere crack to two feet or even more in width. Very frequently too the same vein may show an equal variation in width

\*See editorial in issue of January 1st, 1909.

by him, representing several of these veins from the western part of Tudhope and the central part of James Township, by far the largest proportion at least was plagioclase varying in composition from albite through oligoclase to andesine. This diagnosis was corroborated in part by a separation of the mineral constituents by means of a heavy solution. The plagioclase thus separated varied in specific gravity from 2.609 to 2.635. Some of this plagioclase (albite) had distinct rectangular or lath-like outlines, showing twinning according to both the albite and percline laws, which in certain cases produced a fine "cross-hatched" structure usually considered characteristic of the appearance of microcline between crossed nichols. Most of the grains are quite turbid. Another species of plagioclase (oligoclase) occurs in irregular, untwinned and clear grains, thus resembling quartz, but unlike quartz this mineral is readily fusible. Some of these veins contain a considerable admixture of quartz, this mineral often forming graphic intergrowths with the feldspars. In certain of these cases, the feldspar has acted as the host, but in others large grains of quartz were noticed containing only a few shred-like individuals of the plagioclase. Calcite is usually present and sometimes very abundant. This mineral frequently occurs in fairly large grains or in granular aggregates made up of several individuals disseminated through the more abundant feldspathic material. It also occurs in more or less continuous vein-like areas or masses, anastomosing between and sometimes penetrating through both simple and composite individuals of feldspar. Portions of the vein where exposed to the action of the weather or percolating waters, frequently present a finely cavernous or sponge-like appearance, due to the etching and removal of the calcite, leaving small and irregular shaped miarolitic cavities lined with minute tabular crystals of feldspar. Oxidation of the iron sulphides usually present gives a prevailing pale brownish to an almost black color to these portions of the vein. Not infrequently barite, usually pale pink in color, and occasionally celestite occur with or replace altogether the calcite and feldspar.

"Some of these veins are therefore made up almost wholly of red feldspar, almost always a plagioclase near the acid end of the series, together with a very subordinate amount of calcite and a still smaller quantity of quartz. Other veins again are made up of an almost equal proportion of plagioclase and calcite and sometimes quartz, while still other veins present a finer grained feldspathic portion in the vicinity of the walls, with the whole mass of the interior made up of comparatively coarse grained calcite with sometimes a small proportion of quartz. The stages represented completely by these vein occurrences in these districts show a perfect and practically uninterrupted continuity during their consolidation from an original condition of hydro-igneous fusion characteristic of the magma from which the comparatively fine and even grained feldspathic material is believed to have resulted, to conditions of igneo-aqueous solution which must have obtained in the viscous mass from which the latest calcite or quartzose segregations had solidified.

"Chalcopyrite is the most abundant and common of the metallic constituents, but bornite is also very frequently encountered, both of these sulphides often occurring side by side in the same vein. Covellite also occurs, but much less frequently. Galena is also very common, and usually carries silver in variable quantity. Many of the veins contain micaceous or specular iron

ore (hematite), and some of them are entirely made up of this material, at least near the surface. Several veins were noticed made up of alternations of chalcopyrite and specular iron ore. Very frequently a vein containing specular iron ore is replaced at a depth sometimes of only a few feet by chalcopyrite, smaltite, and native silver. In the Hubert Lake area veins of magnetite have been found, similar to those of hematite in the Township of James. Malachite and azurite are both common. The cobalt minerals, either smaltite or cobaltite, are very prevalent usually in association with more or less niccolite. Erythrite (cobalt bloom), and annabergite (nickel bloom) are also frequently present as surface decomposition products. The smaltite-niccolite veins often contain the white bloom near the surface, which is formed by the reaction of these minerals upon one another when subject to weathering processes. Most of these veins will give assay values in silver varying from a fraction of an ounce to thirty ounces or even more per ton, although the material on which the trials were conducted showed no signs of the native metal.

"Silver is also of common occurrence in these veins, both in the native state and as argentite (sulphide of silver). As native silver it occurs in nuggets of various shapes and sizes, as well as in fine flakes and scales disseminated through any of the various gangue minerals, feldspar, calcite, barite, or quartz. Beautiful fern-like skeleton crystals of native silver are frequently found in certain cavities in these veins from which the enclosing calcite has been removed as a result of weathering. It would be unwise in this connection to give any detailed list of the many mining locations on which native silver has been discovered or to mention what are at present regarded as the more promising individual discoveries. It may be sufficient to say that several veins have been uncovered, varying in width from 4 to 8 inches, much of the material from which would average from 25 to 75 per cent. of native silver, while a large number of other veins have been proved to contain silver in such quantities as to merit further and quite extensive mining development work. The mode of occurrence and association of this silver in some of these veins bears a striking resemblance to that obtaining in the veins cutting the diabase in the vicinity of Kerr Lake near Cobalt. It seems therefore very reasonable to assume that many and possibly wider and richer veins will be revealed as a result of this season's mining operations, when conditions should be much more favorable for prospecting and development work.

"It may be well in this connection to mention and even to emphasize some of the points which should strengthen the opinion that the Montreal River mining district will become in the near future a permanent mining camp.

"1. The wide extent of country over which these mineral veins have already been found.

"2. The large number, width, continuity and well-mineralized character of many of the veins so far located.

"3. The very general presence of native silver in these veins.

"4. The great richness of some of the ore already secured, some of which compares favorably with the best found in the veins of Cobalt. The region is certainly one of great promise, and worthy of the most earnest and intelligent search.

### Geological Association of the Ore Deposits.

"All of these veins occur in diabase or gabbro, a rock which represents the consolidation of a lava of basic composition which has been intruded in the form of laccoliths and dykes through rocks of Huronian, Keewatin and Laurentian ages. The rocks representative of the Huronian are conglomerates, slates, and arkoses or quartzites, very similar in structure and mineralogical composition to rocks of the same geological age found in the neighborhood of Cobalt. No rocks of Keewatin age have been found in James Township, but extensive outcrops occur in the central and eastern portions of Tudhope Township.

"The Keewatin is intruded by certain granites and gneisses which are usually referred to as Laurentian. These two rocks form an igneous complex lying unconformably beneath and furnishing the pebbles and other detrital material of which the basal conglomerates of the Lower Huronian are composed. These gneisses and granites cover large areas in the central and northern portions of the Township of Tudhope, also nearly the whole of the Township of Smyth and the northwest corner of James, and thence west and northwest to Hubert Lake and beyond.

"Smaller patches of granite are also exposed as a result of denudation in the southern part of James Township.

"The diabase or silver-bearing formation is the newest rock in the district, as it is intruded through all the other series, cutting even the arkoses and quartzites which are at the summit of the sedimentaries. The distribution of these several formations is well shown on the map of the Montreal River and Temagami For-

est Reserve lately issued by the Bureau of Mines of Ontario, the necessary geological surveys having been made by Cyril W. Knight and his assistants during the past summer.

"All of the veins of economic importance so far discovered appear to be confined to this diabase, which is essentially similar in mineralogical composition and geological age to that in which some of the most productive silver veins of Cobalt are being mined. Occasional fissures, some of them rather wide and continuous, were noticed in the conglomerate filled with calcite, quartz, and barite, and carrying galena, but the assay values of such material were disappointing. It is, however, reasonable to suppose that productive veins will yet be found, although extensive outcrops of the rock usually shows very little fissuring. Most of the hand specimens of the diabase which were given to Dr. Young for microscopical examination were collected in the vicinity of one or other of the mineral bearing veins and therefore doubtless show more advanced decomposition than would be the case had the material been secured from exposures farther removed from the influence of such eruptive afteractions.

"As a result of our prospecting work in the Township of James, we are now in possession of two mining locations, the S. E.  $\frac{1}{4}$ , North  $\frac{1}{2}$ , Lot 9, Con. V., now known as M. R. 202, and the N. E.  $\frac{1}{4}$ , N.  $\frac{1}{2}$ , Lot 12, Con. 4, known as M. R. 422."

In the next issue of the Canadian Mining Journal Dr. Barlow's reports on the same district and on the Miller Lake areas will be touched upon. Mr. D. B. Dowling's report on the Albertan coalfields examined by him will receive attention.

## BOOK REVIEWS

**A Study of Ore Deposits for the Practical Miner, with Descriptions of Ore Minerals, Rock Minerals, and Rocks. By J. P. Wallace. Illustrated. \$3.00 net prepaid. Hill Publishing Company, 505 Pearl Street, New York.**

The title of this volume may fairly be expanded to something like this: "A Study of Ore Deposits for Miners and Prospectors Who Have Had no Technical Education." Possibly this suggested title best defines the object of Dr. Wallace's new work.

From readers of the Canadian Mining Journal there come constant inquiries as to the best book on the subject of ore deposits. Questions of this kind are peculiarly difficult to answer. There are dozens of good books on ore deposits. Most of these, however, are written from the standpoint of geology. Some of them are so thickly befogged with hypertechanical modern words that they are intelligible only to the specialist. Others of these books cover but single districts or one particular variety of deposits. Possibly these strictures apply with but little force to several of the more popular books that treat of ore deposits. But in general it will be conceded that a book covering the whole field in an elementary way and at the same time free from the fustian of the schools, has long been desired. Dr. Wallace, we believe, has shot near the mark, if not quite into the bull's-eye.

To define the purpose of the book it is best to quote from the author's foreword: "The book is written for

the average miner, the prospector, and the mining public. It is eminently practical, of simple language, concise in treatment, and deals only with essentials. A knowledge of minerals, ores, and rocks is important to a correct understanding of ore deposits, for all are intimately associated. A brief description, therefore, of these is given. The structural features of ore deposits and the walls enclosing them, together with the form, origin, and manner of occurrence of deposits, have been given special attention. . . Descriptions of prominent mines of various type and forms are presented chiefly to exemplify and enforce the principles herein set forth governing the deposition and occurrence of ores."

Ore minerals are taken up in Part I. The physical properties of minerals are outlined succinctly, and then the minerals that constitute the ores and metals are dealt with in groups.

Part II. discusses the rock-forming minerals, rocks, and rock displacements. This section is lucid and comprehensive.

Part III., General Characters and Classes of Ore Deposits, sketches the principles of ore deposition, vein formation, ore bodies in general, etc.

Part IV. is a series of descriptions of ore deposits of many well-known and characteristic mines and workings the world over.

Part V. is a summary of the art and practice of mine valuation and prospecting.

The volume is designed, as has been noted above,

for the benefit of the non-technical reader, whether he be a miner, a prospector, or an investor. Undoubtedly it affords a clear and sufficient introduction to mining geology. Its freedom from technical polysyllables is a virtue.

Here a point may be raised. Both the selection of matter to be included in such a book and the rejection of material considered unsuitable or unnecessary are tasks bristling with difficulties. In one respect we think that Dr. Wallace's volume might have been improved. He has made no mention of chemical symbols and formulae. No doubt the non-technical reader fights shy of anything resembling chemical notation. Long, loose, and complicated equations are intelligible only to the expert. But it is decidedly necessary for any reader to acquire a knowledge at least of the symbols that represent the elements.

This may be taken, not as dispraise, but as alluding to a debatable point.

Finally, both author and publishers deserve large credit in bringing out a book that should and no doubt will form the connecting link between thousands of lay minds and a study of absorbint interest and of immeasurable importance.

**A Manual of Practical Assaying.** By the late H. Van F. Furman, E.M. Revised by William D. Pardoe, A.M. 8vo., 497 pages. Illustrated. Cloth, \$3.00. Sixth edition, revised and enlarged. John Wiley & Sons, New York; Chapman & Hall, Limited, London.

Since its first edition appeared in 1893, Furman's "Assaying" has been a deservedly popular manual both in the class-room and in the laboratory. It is among the best of the many books that attempt to cover completely or partly fire-assaying, gravimetric analysis, and volumetric analysis.

The primary importance of careful sampling, whether the chemist is dealing with ores or with metallurgical products, is recognized, and sixteen pages are taken up with descriptions of sampling methods and devices.

By intelligent preliminary examination of the material submitted, the assayer saves time and labor. Chapter III. recapitulates the principal determination blowpipe tests.

Chapter IV. takes up apparatus and operations. Crushing and other appliances are described in general terms, and the operations of weighing, filtering, etc., are touched upon. The absence of minute details as regards muffle furnaces, balances, etc., is to be commended. The chemist can always secure these in any of the numerous trade catalogues that are to be had for the asking. However, since several diagrams of muffle furnaces are used, it would be an improvement to replace the present cuts with more modern representations.

Chapter V. is a short classified description of re-agents, grouped under the heads of fluxes, solvents, precipitants, reducing re-agents, oxidizing re-agents, and indicators.

Part II., comprising 160 pages, outlines the analytical methods employed in determinations of the principal metallic and non-metallic elements. Special assays and analyses, such as the assay of base bullion and the analysis of gases and of water, form the subjects of this section.

The writing of chemical equations, the calculation of lead blast-furnace charges, and like operations, the preparation of pure gold and silver, the mechanical assay of gold and silver ores, etc., are among the chapter-subjects of Part IV. Useful tables of analytical results and factors are appended.

In this sixth edition the reviser has rewritten the chapters on zinc, water, and coal analyses, and has added chapters on the assay of telluride ores, tungsten, molybdenum, and vanadium.

The discrimination with which the limited space allowed for each topic has been used is evident in many pages. For instance, in the chapter on coal and coke the correction factor for loss of moisture in powdered coal, recommended in the Report of the Committee on Coal Analysis, is noted.

The chapter on copper needs re-writing. The statement that "the cyanide method is generally more accurate and preferable to the battery method" requires serious qualification.

On the whole, Furman's "Practical Assaying" is a book of distinctive merit. It is a book without which the library of the assayer and chemist can hardly be considered complete.

## EXCHANGES.

**The Engineering Magazine, January, 1909.**—Mr. A. Selwyn-Brown continues in this number his study of the principal Australian gold fields. His article, "Metallurgical Practice in the Gold Fields of West Australia," has one particularly interesting section on wet crushing. A table in this section gives details of stamp-mill practice:—

|                           | Golden<br>Ivanhoe. | Horseshoe. | Oroya-<br>Brownhill. | Lakeview<br>Consols |
|---------------------------|--------------------|------------|----------------------|---------------------|
| Number of stamps.....     | 100                | 150        | 50                   | 70                  |
| Monthly tonnage .....     | 19,000             | 23,000     | 11,000               | 11,000              |
| Daily tonnage, per stamp. | 6.35               | 5.50       | 7.35                 | 5.50                |
| Weight of stamp in lbs..  | 1,200              | 1,270      | 1,100                | 1,200               |
| Drop in inches.....       | 7.5                | 8.0        | 7.75                 | 80                  |
| Number of drops per min.  | 104                | 104        | 108                  | 102                 |

About 20 to 40 per cent. of the gold in the ore is saved by battery and plate amalgamation. Some of the mills, the Oroya-Brownhill, for instance, do not use plate amalgamation.

The "continuous" process of cyaniding is used principally. The finely ground ore is kept in contact with cyanide solution throughout the treatment. The battery water in the west-crushing plants carries from 0.003 to 0.007 per cent. potassium cyanide in solution. At a few mills bromide of potassium is added to the charge. Some of the ores treated by bromo-cyaniding yield 95 per cent. of their gold tent. Filter pressing for removing the used solution from the sand and dslime has replaced decantation.

Below water level in most of the fields the ores carry larger percentages of sulphides and concentration is resorted to. The concentrates are roasted, ground, and either amalgamated or cyanided.

**Electro-chemical and Metallurgical Industry, January, 1909.**—In an article comparing the electric furnace with the blast furnace, Mr. J. Harden, having established data that afford a fair basis of comparison, relegates the electric furnace, in its present stage of development, to localities where there are large deposits of

cheap iron ore and abundant water power. He indicates the desirability of keeping "some of those optimists a little nearer to the earth, who dream that the days of the good old blast furnace are doomed, and must give way to the more modern electric smelting."

**The Mexican Mining Journal, January, 1909.**—In summing up the prospects of the Mexican mining industry for the coming year, our contemporary speaks in part as follows: "The continued low price of silver is turning attention to the production of the base metals and to the treatment of the complex ores heretofore disregarded, and the opportunity in this line is enormous in Mexico. . . . The prospects for the Mexican mining industry are bright, for it has as a basis the most extensively mineralized large area in the world, and the business is now largely in competent hands, backed by sufficient capital." Does not the Mexican Mining Journal make too large a claim for the extent of the mineralized area of Mexico? The vast mineralized area of the Rocky Mountains of British Columbia, Alberta, and the Yukon must be taken into consideration in any such assertion.

### CORRESPONDENCE.

To the Editor of the Canadian Mining Journal:

Dear Sir,—I have just read again with a great deal of interest Mr. O. D. Skelton's paper in your issue of November 1st, on the taxation of mineral resources in Canada, and I wish to compliment the scholarly Queen's professor on his bright, clear, and solid resume of such a complicated question, and to express the hope that Mr. Skelton will favor us with other valuable papers on this subject, discussing more in detail its important and controverted phases. Of these I believe there are several that should be thoroughly threshed out, one by one, before the public and before our legislatures. If that were done, I feel that it would conduce to an entirely different public understanding of the whole question. Permit me to suggest below a few of these points:—

1. Are not mineral resources and mineral properties in Canada already bearing their just share of taxation, quite like other resources and properties, without the additional royalty tax imposed upon them, such, for instance, as in Ontario by the Supplementary Revenue Act, 1907?

2. If so, are not the extra special taxes, commonly called mining royalties, not only unfair, but very detrimental to the full growth and development of the vast untouched mineral resources of this great country, and therefore are not such taxes causing great loss and injury to the whole country?

3. If not so, and special taxes should be imposed, cannot a form be given to that tax (such, for instance, as the form of acreage tax) which would make of it an important factor in the great object to be attained, namely, a much fuller development of the mining resources and industry?

4. If a special tax is imposed, in whatever form, should it not bear on all mineral resources and properties alike, proportionately?

5. Should there be reserves, exceptions, and compromises in the selling of mineral lands or in the granting of mineral leases through which certain mineral resources and properties are finally taxed infinitely

more than others, or become Government owned and operated mines?

6. Should mineral lands acquired in fee without reservations before the passing of a Supplementary Revenue Act, or any other Act imposing a special tax or royalty, be subject to these taxes or royalties?

7. Can export taxes be legally and properly imposed by Provincial Governments, such as the tax imposed on exported natural gas by the Ontario Government?

8. Should not the capitalization of mining companies be limited by the imposition of a heavy tax on their capitalization, or by other means?

In another letter, Mr. Editor, I shall answer these questions one by one, openly and frankly, and I hope the others will do likewise.

Nothing would help the solution of these most important problems of mining taxation and mining development so much as a thorough and open discussion in the pages of a technical journal such as yours, recognized as the official organ of the mining community all over the country.

Discussions on this subject in the meetings of the Canadian Mining Institute, or at other meetings, are very good, but they lack the deliberation, maturity, and calmness of written discussions in good technical papers.

Yours very truly,

EUGENE COSTE.

Toronto, Jan. 4th, 1909.

### Burns' Steer.

The Editor, Canadian Mining Journal, Toronto:

Sir,—I heartily sympathize with the M.f.C (Man from Cobalt), who, in the Journal of December 1st, protests against your illustrated account of his awful experience with Burns' steer. It was once my good fortune to have a true and trusted friend who got in about as close quarters with a grizzly as the M.f.C. did with the steer. It certainly took away his nerve, and we tabooed the subject in his presence. In spite of this, "oft in the stilly night" the remembrance of the grizzly mix-up would recur to him. The result was that he took to drink, slighted a widow, and went rapidly on a downward career.

If the steer episode is not dropped the M.f.C. is apt to follow a similar course. You can see that he has read your article very closely, even noting the substitution of the word "led" for let. Of course this point would appeal strongly to him. It would curdle his blood to think of actually leading such an animal out of the corral. That account of the Mexican bull fight which appeared in the newspaper of recent date should be kept from him. If this kind of thing continues he will lose all liking for the luscious steaks such as the Mint formally served.

Steers, when excited, have long been known to be the most dangerous of beasts. Did not Hannibal after crossing the Alps use his oxen to stampede the native inhabitants!

PRO BONO PUBLICO.

To the Editor Canadian Mining Journal:

Dear Sir,—In your issue of December 1st you state the desirability of the public receiving a "clear pronouncement" from some of us in the matter of the present boom in Cobalt transactions. By the light of my own experience I do not think the public is easily

reached in this matter through the publi presse One cannot expect a newspaper to condemn its own advertisements. In fact, I believe advertisers expect some protection in this matter.

Thus we are cut off from a contact with the participators of the boom, since mining journals are not much consulted by the speculative public. At a meeting of the Canadian Mining Institute at Toronto in March, 1907, when Cobalt was also much to the front, we were addressed by Sir Mortimer Clark. His speech was one of wise warning against the speculative condition of the mining market. It was very much apropos of the situation, and a following speaker said it ought to be published in every paper in Toronto next morning. It appeared in none of them.

Even if we could place a sane and honest statement before the speculative public it would be useless: the very people whom we seek to dissuade would turn on us for depressing the market inflation by which they hope to profit.

Why should the trainers of "future mining engineers" lecture to mining gamblers. Boom speculation is a curse to the mining industry, but it cannot be reached by academic admonition.

Please make a note of it that the present undesirable condition of Cobalt propositions is not due to "young graduates from mining schools."

We are often treated to stories of their inexperience and unfitness for mining undertakings, but these, it seems to me, are small evils compared with misrepresentation and amongst this misrepresentation mining school graduates are not likely to be found. Yours truly,

J. C. GWILLIM.

#### "MINERAL VEINS IN THE MONTREAL RIVER DISTRICT."

Under this title, in the last issue of the Canadian Mining Journal (December 15th, 1908), Mr. J. B. Tyrrell devotes much of his attention to discussion and, at times, adverse criticism, of some of the main statements included in my "Summary of Conclusions," which appeared at the end of the paper, "On the Origin of the Silver of James Township," read before the Canadian Mining Institute at its last annual meeting (Ottawa, March, 1908).<sup>1</sup>

I can only express regret that in Mr. Tyrrell's opinion this paper as "rather too technical in character and diction to be thoroughly enlightening to the ordinary prospector or miner," for my whole endeavor in its preparation was to avoid as far as possible all unnecessary technical expressions or descriptions. Previous to the appearance of Mr. Tyrrell's observation I had regarded my efforts in this direction as fairly successful, especially as many prospectors and miners had remarked that it was an unusually simple treatment for so technical a subject. At the same time I may be permitted to mention that I was not addressing the "ordinary prospector or miner," but an Institute, which is every year adding to its membership men of the highest technical training and experience.

In regard to the form assumed by the diabase with which the mineral veins are associated, I can only refer Mr. Tyrrell to my statement that it "has been intruded in the form of sills or laccoliths and dykes through rocks of Huronian, Keewatin, and Laurentian ages."<sup>2</sup>

I never made use of the term "batholithic" as descriptive of the mode of occurrence of this diabase, as would appear from the report of the discussion, which unfortunately was not revised by me. I can only repeat, therefore, and would make especial emphasis of the fact, that the diabase or gabbro represents the solidification on cooling of a lava which has been intruded through the neighboring rocks in the forms of sills, laccoliths, and dikes. I have never "forgotten this at times," nor has there been any "uncertainty in my mind on the point." I do not feel obliged to apologize for the use of the term "profound" in describing the fissuring to which the diabase has been subjected, but would explain that it was employed as a synonym for "widespread" or "extensive," expressive of my belief, not only of the persistency to very considerable depths of many of these veins, but also of their proved unbroken continuity over surprisingly long distances in a horizontal direction.

In this connection it may be well to state that in the present state of our knowledge it is difficult to make any very definite statement in regard to the exact thickness of these laccoliths at the various localities where they are exposed; for in nearly every instance a considerable part of the upper portion has been removed by erosion. In addition it is quite conceivable that such intrusive masses should show a considerable variation in thickness from point to point. From a rather critical examination of a large number of these occurrences, however, it may be stated that many of these intrusions must have originally been from 300 to 500 feet thick.

Mr. Tyrrell further says that "it is rather unfortunate that more exact descriptions of these veins are not given," and then proceeds to mention a rather unusual occurrence as illustrative of what he believes to be their prevailing complexity. It is to be deplored that Mr. Tyrrell has not taken advantage of this opportunity to add further to our information in this regard rather than indulge in vain regrets, for the descriptions of these veins already published in the paper mentioned are regarded by the author as fairly complete and representative of the majority of the occurrences that came under his notice.

In all magmas produced from natural causes, water is believed to be present in very considerable amount, so that as crystallization and solidification advances the residual magma or "mother liquor" (menstruum) approaches more nearly to the composition of a mass of fused feldspar together with a comparatively large amount of water. It is at this somewhat indefinite stage in the cooling of the diabase that the pegmatite (aplite) began to form. Mr. Tyrrell's description of "pegmatite" as an "aqueous" rock is however not only unusual, but not strictly scientific, in spite of the fact that water has played an important role in its formation; for extreme cases, in which vein action is most pronounced, are now regarded as the products of igneous aqueous solution.

I find myself in substantial agreement with Mr. Tyrrell "that the fissures in which the silver-bearing veins occur have been formed by the shrinking of the quartz-diabase or adjoining rock as it cooled or solidified," but can hardly follow him when he states that "in some cases they (the fissures) extended to the still molten interior or lower portion of the mass of the quartz-diabase and allowed this liquid rock to rise up through them and form narrow dykes. Surely Mr. Tyrrell cannot mean to describe these dikes or veins

<sup>1</sup>Jour. Can. Min. Int., Vol. XI., 1908, pp. 256-273.

<sup>2</sup>Loc. cit. p. 267.

as made up of quartz-diabase, for the so-called "aplite" of the miners and prospectors differs very essentially from its parent rock both in mineralogical composition and structure.

He further states, "Thus the dikes were formed after the surrounding diabase had solidified but while it was still very hot." This, in my opinion, is only a portion of the truth; for while many of these veins or dikes are abruptly differentiated from the associated diabase, exhibiting perfectly sharp and, in some cases, "free" walls, others show a gradual transition from the vein material (pegmatite) into the surrounding diabase, which gradation can only be explained on the assumption of a commingling of material while both were in a fluid or, at most, a viscid condition and before complete solidification had taken place.

Not only the native silver, but also the characteristic sulphides and arsenides began to be introduced along with the first pegmatite (aplite) filling. These metallics did not wait for the reopening of the pegmatite and the introduction of more abundant calcite, for this latter mineral accompanied and overlapped the crystallization of the feldspar.

It is perfectly legitimate to speak of the more feldspathic types of these occurrences as either "dikes" or "veins," for the feldspar is just as much secondary and the gangue of the metallic minerals as even the calcite or quartz. The pegmatites not only "have a distinct significance in defining the positions of the most important fissures," but they are themselves the "ore bringers."

The use of the terms "dike" and "vein" as separate names in regard to pegmatite is misleading. The strict limitation of their meaning has led to certain misconceptions as to its manner of formation. I would prefer to make the two terms synonymous, or, better still, to use "vein" in both senses, for, accurately speaking, every "mineral vein" is intrusive into the surrounding country rock.

ALFRED E. BARLOW.

Montreal, Dec. 26th, 1908.

(NOTE.—Mr. Tyrrell's manuscript reads "igneous" but by some inadvertence, "aqueous" was substituted for it in the printed article.—Ed.)

## INDUSTRIAL NOTES.

**Air Compressors.** Catalogue No. 100 of the Thos. H. Dallett Co., Philadelphia.—Of massive construction and up-to-date design, the compressors made by this company are built to secure high efficiency. The present catalogue illustrates only the standard belt- and steam-driven compressors. The company designs and builds machines direct connected to motor, water-wheels, or gas engines. The frame of these machines is rigid, massive, graceful, and designed so as to place ample support under the main bearings. The air cylinders are made of a special, hard, close-grained iron. All steam cylinders are lagged with mineral wool and jacketed with planished sheet steel. Other features, too numerous to mention, mark the Dallett compressors as durable and serviceable machines.

**Circular No. 1118, December, 1908,** issued by the Canadian Westinghouse Company, Limited, Hamilton,

Ontario, is devoted to that company's Type CCL Polyphase Induction Motors. Like all of the Westinghouse publications, the pamphlet before us is excellent in make-up and matter. The variety of electric motors available now is enormous. This circular presents, succinctly and clearly, an accurate idea of the merits of Westinghouse polyphase induction motors of the squirrel cage type. A particularly commendable and important feature of these motors is their absolute freedom from sparking. It is claimed for them that they can be used with entire safety in places surrounded by inflammable or explosive material.

**Catalogue 67 D. The Jeffrey Manufacturing Company Columbus, Ohio. "Jeffrey Rubber Belt Conveying Machinery."**—The science and practice of conveying ores, fuels, and other materials by means of rubber belts have made enormous strides in the last decade. The Jeffrey conveyors represent probably the last word of progress in this direction. Catalogue 67 D. illustrates belt conveyors for all sorts of materials—coal, gold ore, stone, slimes, asbestos ore, mill refuse, etc., etc. On page 3 a short list of order specifications is given. Mine operators should secure copies of this catalogue. It is profitable.

## PERSONAL.

Mr. Alex. Gray, of Montreal, was in Toronto on Jan. 7th.

Mr. Chas. Fergie has taken temporary headquarters at the Windsor Hotel, Montreal.

A postponed meeting of the council of the Canadian Mining Institute was held in Toronto on Saturday, January 9th.

Mr. Broadbent, collector for the National Mineral Museum, has been detailed by the Geological Survey of Canada to collect British Columbian minerals for the Seattle Exposition next spring.

Mr. W. A. Carlyle, of London, England, at present consulting engineer to the Le Roi Mining Company, Rossland, B.C., has been offered the professorship of Metallurgy in the Royal School of Mines.

The annual meeting of the Mining Society of Nova Scotia will be held on March 3, 1909, at the rooms of the Society, 129 Hollis Street, Halifax, N.S. The annual dinner will be held during the session. Delegations from Ontario, Quebec and the United States are expected.

Tantalum is one of the world's rare materials that has been suddenly produced in commercial quantity in response to a demand for it. The name is said to have been given by Ekeberg, the Swedish discoverer, on account of tantalizing difficulties encountered in investigating it, and only recently has it been obtained in a state of purity. The mineral yielding it was a few years ago so hard to find that museums could not be supplied with specimens. Australia alone now furnishes more than 70 tons of tantalite a year—not a large supply, but enough for present needs, as a single pound of tantulum gives filaments for 25,000 lamps of 25 candle-power.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

**Glace Bay, Jan. 4.—Naked Lights vs. Safety Lamps.**—The verdicts of coroners' juries are things to be wondered at. The jury which sat on the victims of the recent Marianna explosion in the United States was referred to by the Engineering and Mining Journal as being composed of farmers, and described as "more than usually fatuous." Under the above caption we referred in the last issue of the Journal to the verdict on the men who were killed at Port Hood about a year ago. We now have to refer to the verdict which was given by a jury that sat at Chignecto Mines on Christmas Eve, 1908, which read as follows: "John H. Coleman and George Sawyer came to their death by suffocation in the mines of the Maritime Coal, Railway & Power Company, Joggins, on the 24th of December, 1908. We recommend that in future asbestos or other material be used by the company for bratticing when anyone has to pass with open lights." For pure unadulterated fatuity we think the Nova Scotian verdict will be hard to beat. The accident was caused by the ignition of bratticing by the lights carried by the men. In the last correspondence written in November we remarked as follows: "The foolishness of naked lights in coal mines, to our mind, needs no emphasis. A coal mine is a place where inflammable material is dug out, and the surroundings of men who work underground are such things as coal, wood, an inflammable dust capable of detonation, explosive gases, brattice cloth, and tub grease." In a recent official report to the British Home Office the statement is made that so long as open lights are used explosions, and mine fires may be expected to occur with more or less regularity, and that the law in its present state is inadequate to forbid their use. Fortunately, our Nova Scotian law is adequate in this respect, and it may be that instead of ordering asbestos brattice cloth, the powers that be will remove the naked lights. It would seem the simpler thing to do. Seriously speaking, the incident just referred to is only one of the constantly recurring reminders that naked lights in mines belong to the days of furnace ventilators, black powder and home-made squibs. That we should still be using naked lights in coal mines so many years after Davy is a reflection on our intelligence. We think it will be well within the mark to state that not a single mine explosion or mine fire would have ever taken place in Nova Scotia had the use of safety lamps been compulsory and the use of naked lights prohibited. That this attitude is not a peculiar one is evidenced by an article that recently appeared in the Maritime Mining Record, written by Mr. C. J. Coll, of the Acadia Coal Company. No one will question Mr. Coll's knowledge of his subject or his ability to pronounce on any matters connected with Nova Scotian mining. We are therefore glad to see that his condemnation of naked lights in coal mines is unqualified, and once more venture to repeat "that naked lights should be forbidden, and nothing but properly approved and tested types of safety lamps be used in every coal mine in the Dominion." Some responsible persons who should know better have recently expressed the opinion that mine explosions are "mysteries" and "acts of God." As was very properly pointed out by a conference of mine inspectors in the United States recently, such opinions merit the strongest condemnation, and are, moreover, hypocritical cant of the worst kind. Most mine explosions occur because "somebody blundered." The most stupid and inexcusable blunder is to continue the use of naked lights, and it is high time that governments should awake to a sense of their responsibility and make it impossible for anyone to make this blunder in the future—and keep out of prison.

**A "Wildcat" in the Maritime Provinces.**—Ontario is not the only land that breeds the wildcat. One of the woolliest of his tribe is now to be found in Nova Scotia. Dr. Hugo von

Hagen, from New York City, is a wizard of finance of no mean order. He bought a property of some 7,000 odd acres at Adamsville, New Brunswick, for \$5,000, and floated a company to operate the seams of coal that are supposed to be in it, with a capital of \$3,500,000, and although no coal has as yet been mined, and so far as we can learn only three men are working on the property, the company is paying a monthly dividend! This same gentleman is carrying on a similar affair at Maccan, in Nova Scotia. It would not be amiss if the Attorney-Generals of the two provinces that have been favored by Mr. von Hagen's projects were to make a few inquiries into these truly remarkable mining companies. Mr. von Hagen in a circular to his shareholders states that he has obtained a contract to supply the German navy with coal—from New Brunswick, too!—and has also elased a contract for 500,000 tons with a large English coal broker. The German navy will cease to be the bugbear that it now is to our folks at home if it depends on Von Hagen's mines for fuel. Is it not about time that someone stopped the little game of this visitor from New York—the East Side, we presume?

**The British Workmen's Compensation Act.**—It was predicted that the operation of the Workmen's Compensation Act in England would eventually kill the provident societies that have been so great a help to the working classes in helping them in thrift and in providing for them in sickness. That that prediction was not without grounds is being daily proved by the reports of the friendly societies. One of the most important of these societies in England is the Independent Order of Druids, which has 71,000 members, nearly all drawn from the artisan and working classes. At the half-yearly meeting of this society held in Sheffield during November, some serious facts were ventilated. One of the delegates said the Compensation Act had a lot to answer for. "It made some of their members what they never should have been. When a man was drawning his compensation, his club money, and sick pay, he was unfortunately very loath to start work again." Owing almost entirely to the increase in claims caused by the malingering which the Compensation Act is fostering, the claims upon the funds of the society showed an increase over the corresponding half year of over \$55,000. We quote from the report: "Not only has the whole of the members' contributions been absorbed this half year, but in addition no less a sum that £2,221 13s 7d has been taken out of the money realized on our investments to pay the liabilities of the half year ending June 30th, 1908." It was admitted that the miners, because of the workings of the Compensation Act, were unprofitable members of the order, and a proposal to exclude them from membership received large support, but was not carried. A motion to reduce sick pay by one-third to members in receipt of compensation from employers was carried by 30,000 votes to 24,000. This meeting is typical of the half-yearly meetings of all these provident societies. All their reports tell the same story. For many years these self-sustained associations of workmen for mutual help have been the pride and the mainstay of the better type of worker, but their gradual extinction is now assured. As the delegate we have quoted says, the "Compensation Act has a lot to answer for." And the end is not yet. The accumulating burden of this piece of legislation is only beginning to roll up. The Old Age Pension scheme in England is the necessary corollary of the Compensation Act, and it is to be followed by the Eight Hour Act for mines. Is it any wonder that we hear of unemployed and thriftless working classes in England, or that English capital looks abroad for investments? In all these recent enactments all volition and all onus is taken from the worker and placed on the shoulders of the capitalist and the state. So far,

the result is not enlivening. The House of Lords threw out the Licensing Bill, which proposed to limit the sale of liquor, but they passed the Eight Hour Act, thereby endorsing the cry of "less work and more booze," which finds favor with an ever-increasing number.

#### ONTARIO.

**Cobalt.**—The year 1908 has been a period of hard work, construction, development and largely increased production for Cobalt. When all returns have been secured it will be seen that the value of the year's shipmentss, notwithstanding the decreased price of silver, will be 50 per cent. greater than for 1907. There are now 30 shipping mines. Ten of these have been added to the list during the present year.

In point of tonnage La Rose stands first with 4,797.73 tons to its credit. Next comes Ippissing with 3,474.50 tons; then O'Brien, 3,439.08 tons. The McKinley-Darragh, Trethewey, and Drummond were next in tonnage.

It is obvious, however, that many mines with small shipment records, the Coniagas, Crown, Reserve, Kerr Kake, and others made up in quality what they lacked in quantity.

The fact that the stock boom has switched past Cobalt and has taken its way up the Montreal River is a matter that pleases all resonsible operators. No boom is wished for here. It is not needed. Booms are too expensive. We have had our share.

September was the banner month. Its record of 3,049.14 tons beats all monthly figures up to date.

The rich finds on Crown Reserve and Temiscaming were the outstanding features of the year's operations. Along with these these may also be mentioned the excellent showing made by the Trethewey under the management of Suprintendent McNaughton.

Most of the old shippers preserved and improved their rank during the twelvemonth. There were, however, one or two casualties. Red Rock and Green-Meehan disappeared, and Foster dropped far behind.

Two custom concentrators are in operation and both are doing good work. The Northern Custom Concentrator has a capacity of 100 tons per day. The Nipissing Reduction Company is rated at 50 tons per day. Both these plants are milling the dumps and are effecting a good saving.

The Coniagas mill is working in better shape than ever before. The addition of twenty stamps has made a decided change in the practice obtaining here. The Cobalt Central mill is in continuous operation. Good reports come from the Buffalo mill. The new O'Brien mill will be completed before spring. It will embody many new features.

In the life of the camp the Canadian Mining Institute has become a decidedly interesting factor. The periodical meetings are looked forward to with eagerness. The discussion all always profitable and sometimes white hot. They afford a useful vent for the airing of opinions and the setting of differences. Mr. A. A. Cole, Mr. E. L. Fralick, and Mr. H. P. Davis have been among the most active in promoting the movement and adding to the membership of the Institute.

The unusual number of accidents that have been recorded during 1908 impresses one with the need of more rigid enforcement of the law. Inspector Corkill has recently closed down several mines for non-compliance with regulations. It is decidedly up to the superintendents to see that unnecessary risks are not taken. The employment of green men in positions of rsponsibility is one of the chief causes of disaster. A few convictions and good hard sentences would clear the atmosphere.

The Larder Lake country has not been attracting much attention lately, although a pocket of very rich ore was found on

the Harris-Maxwell property early in the summer. Mr. Neil Macdonald has been conducting a mill test on the ore of that property, but with what result is not yet known.

From the table of returns [see Statistics and Returns] it will be seen that the silver production is almost 18,500,000 ounces. It will also be noticed that the greatest bulk of the high grade ore went to Copper Cliff, Deloro, the Balbach Company, and Perth Amboy. Thorold took 180 tons. This year, of course, Thorold will receive a much larger proportion. Denver took over 60 per cent. of the low grade ore.

Cobalt enters upon the new year with every confidence in her ability to increase her earning power, decrease her costs, and generally show the world at large that she is here to stay.

#### BRITISH COLUMBIA.

**Grand Forks.**—(Abstract of letter from Manager A. B. W. Hodges, of the Granby Consolidated Mining, Smelting & Power Co.)—At the mines there has been no specially large construction undertaken during the last year. All our new work—that is, the completion of the Victoria shaft and the crushing and conveying apparatus at the Curlew, was all finished, I think, before 1908, and since then we have done nothing special in construction, except ordinary development work and diamond drilling, and have maintained an output of over one million tons during the year.

At the smelter the total ore treated was 1,037,089 tons, producing 23,535,009 lbs. of copper, which is the largest year's production.

We have spent a great deal of money in new construction at the smelter, and the following new work has been done during the year: New ore and coke storage bunkers 1,000 feet long, each, have been installed, holding about 7,000 tons of ore and 4,000 tons of coke.

We intend enlarging our 8 blast furnaces from their present length of 18 feet to 22 feet by 33 inches wide, and one of these is already enlarged and in operation. We have also added two Connersville rotary blowers of 30,000 cubic feet per minute capacity each. These are operated as before by two 150 h.p. motors each. We have also built a new steel dust chamber at the back of the furnaces to replace the old brick one which was torn down. Have also enlarged the brick part of the flue from the steel flue dust chamber to the brick stack. Our blowing engine-room, which was of wood, has been completely torn away and a new thoroughly fireproof building has been installed in its place. The building is of steel and brick, with cement floors. This was made large enough to accommodate the two new blowers and also the new blowing engine.

The converter department has been materially enlarged by adding 80 feet in length to the main building, also enlarging the lining machinery, and we will also install three large converters 7 feet by 10½ feet. These will replace two of the old ones which we have in operation, and when the plant is complete we will have three large converters operated by electricity and one small one, which will give us a capacity of 36,000,000 lbs. a year.

We also installed a two-cylinder 40x40x42 electrically operated blowing engine, manufactured by the Nordberg Mfg. Co., of the latest style and type, of 10,000 cubic feet capacity per minute at 12 lbs. pressure.

At present we have a smelting caacity of about 3,000 tons a day, when all our furnaces are enlarged—about June next—we will have a smelting capacity of about 4,000 tons a day with the eight furnaces.

There are many improvements, such as water pipes, change of electric plant, etc., etc., which I have not mentioned in detail, but which had to be done to accommodate the increased capacity.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Glace Bay, N.S., Dec. 30.**—It is reported on good authority that the North Atlantic Collieries Company at Port Morien and the company owning the Broughton areas will shortly join forces, and also that the coal lands owned by Manager Cowans, of Springhill, near Morien, will be taken over by the combined company. Manager Richardson, of the first-named organization, is at present in England, and it is expected that the deal will go through within the next six weeks.

**New Glasgow.**—The Nova Scotia Steel & Coal Company, Limited, during 1908 were able to make on their output tally sheet larger figures than ever hitherto shown for coal, ore, and some other of their operations. Where decreases had to be chalked up, they were so small as to be practically negligible. The generally quieter atmosphere of the past year was taken advantage of to prepare by improvements and extensions for the increased business which the company confidently expected 1909 and the following years to bring.

The coal resources of the Scotia Company, on the north side of Sydney Harbor exceed two hundred million tons, with five collieries completely equipped, the combined output of which during the coming year will be easily over 4,000 tons per day, which quantity they hope to be able to market, and, barring accident, will do so, if the transportation and manufacturing machinery of the Dominion is given full employment during 1909, which the vastly improved financial condition and constant growing needs of the country warrant us in assuming will be the case.

The business done during 1908 is partially shown by the following figures:—

|                                                                      | Tons.   |
|----------------------------------------------------------------------|---------|
| Coal mined and shipped exceeded.....                                 | 725,000 |
| Broke made .....                                                     | 90,000  |
| Iron ore mined.....                                                  | 360,000 |
| Limestone and dolomite quarried .....                                | 51,000  |
| Pig iron made.....                                                   | 55,000  |
| Steel ingots .....                                                   | 52,000  |
| Steel billets rolled at mills, New Glasgow .....                     | 53,000  |
| Steel bars, sheets, and forgings manufactured from New Glasgow ..... | 45,600  |

The slowing down from the high pressure of the previous year, carried with it opportunities which were taken advantage of to carry out some schemes of replacement and further betterment in connection with the New Glasgow plant, as well as at at Sydney Mines.

At Wabana the driving of the pair of slopes or tunnels to the submarine ore areas of the company was prosecuted most

vigorously and most successfully, and a few weeks ago these slopes passed through the boundary of the intervening ground between the land areas and the submarine areas of the company, and opened up one the latter a seam of ore equal in quality and purity greater in height than that worked on the surface. The submarine territory thus opened up, and from which we can immediately obtain considerable supplies of ore, is of very great extent, and the one seam alone on which we are now driving may be safely estimated to contain five hundred million tons of ore equal to the best Wabana has ever produced.

### BRITISH COLUMBIA.

**Quesnelle Forks, Dec. 24.**—The property, which has been successfully worked in a small way for several years, has now been bonded to Messrs. L. D. Taylor and A. C. Hirschfeld, of this city, for three years. Word has arrived from F. P. Miller, superintendent of the mine, that indications show that a good clean-up may be anticipated next season. Already a gang of men is at work building a retaining dam, and about ten more lengths of sluices will be added to those at present in place. With a plentiful supply of water now assured by the dam, the season's work will be considerably lengthened and the output increased.

### SASKATCHEWAN.

**Punnichy, Sask., Jan. 6.**—Coal has been discovered in the Touchwood Hills, within five miles of the Grand Trunk Pacific. For the past three years, in fact ever since the Grand Trunk Pacific commenced grading through the Touchwood Hills, several men have interested themselves in the coal deposits in that region. As a result of their investigations, a company has been formed in Montreal, called the Saskatchewan Coal Land Prospecting & Developing Syndicate. Harry Wilson, of Montreal, is the syndicate's engineer.

The main vein is supposed to run through the Gordon Indian reserve. The Indians have surrendered all lands on which coal may be found to the Dominion Government, which has in turn leased the mining rights to the company. The samples show a good quality of lignite. The deposits extend northwest to the Grand Trunk Pacific between Touchwood and Punnichy stations.

### ALBERTA.

**Lethbridge, Alta., Dec. 24.**—The first car of coal was shipped from the Royal mines over the new spur recently completed. It was billed to Regina. All shipments will now be made over this spur.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

Arrangements are being made by the coal owners of Fifeshire and Clackmannan, Scotland, for the erection of a rescue station at Cowdenbeath. A team of men will be trained for rescue work at each of the pits.

The Institution of Gas Engineers has decided to endow a professorship of fuel and gas engineering at Leeds University as a memorial to the late Sir George Livesey.

### NORWAY.

The Evje nickel mines situated in the valley of Sotersdalen, which in 1907 produced 5,781 tons of nickel ore, have been sold to a company represented by Admiral Borresen and Director Sn. Eyde.

### RUSSIA.

The Government has drafted a law for the progressive taxation of government land allotted to mines, with the object of preventing more land being taken up than can be profitably worked. A previous enactment framed with the same view was much more drastic, but its operation was suspended.

### GERMANY.

As a result of the diamond discoveries in German Southwest Africa, the Colonial Office has instructed the Governor of the colony to impose an import duty of 10 marks per carat on diamonds. Negotiations are on foot for the organization of a German prospecting company to form the centre of the German African diamond trade.

**AUSTRO-HUNGARY.**

A terrible explosion of fire-damp occurred on December 16th in the Doman coal mines, near Resicza, Hungary. The bodies of 13 miners have been recovered.

A Swiss firm of boring contractors is prospecting for petroleum in Szemelye Bartia, Saros County, Hungary, on territory that has been favorably reported on by geologists. Oil indications have been found at a depth of 430 metres.

**AUSTRALASIA.**

According to the annual report of the New Zealand Minister of Mines, the production of coal during 1907 was the highest yet attained. It amounted to 1,831,009 tons, exceeding the production of the previous year by 101,473 tons. Operations at the state collieries continue to be extended to meet increasing demands. The manufacture of briquets from the waste slack from the Seddonville state coal mine was commenced in 1907, producing fuel of a high quality, which is largely used on the government railways.

An Iron Bonus Bill has been passed by the Australian House of Representatives, and is now before the Senate and likely to become law. It provides for the payment of a bonus of 12s per ton on pig iron made from Australian ore, and puddled bar iron and steel made from Australian pig iron, and a bonus of 10 per cent. ad valorem on galvanized iron wire netting, wire, and small iron and steel tubes and pipes.

**UNITED STATES.**

Public rescue stations are to be established in the coal mining centres by the U. S. Geological Survey. They will be equipped with the latest life-saving apparatus, and be in charge of government engineers. The parent station at Pittsburg will take charge of the West Virginia and Pennsylvania districts.

The Mikado of Japan has purchased for \$100,000 the largest antimony mine in America, situated in Alaska, in order to obtain material for smokeless powder and metals for making steel ships proof against barnacles.

The iron ore production of the Lake Superior region for

1908 approximated 26,000,000 tons, as against 42,165,000 tons for the preceding year. Of the total shipments 18,000,000 tons came from the two Minnesota ranges.

There has been a remarkable increase in the use of electric power for hoisting and pumping purposes in the Butte, Montana, mining district, which has much improved ventilation, especially in the deeper mines. In several instances the substitution of electricity for steam has reduced the temperature in the mines as much as 20 degrees.

**MEXICO.**

Silver mines all over Mexico are closing down owing to the low price of the metal, as only the highest grade mines can operate to a profit at the present cost of production. Owing to the closing of silver mines, the Oaxaco mining district is attracting much attention, as the values of the ore are largely in gold. Several recent strikes are bringing this district into prominence.

A deposit of sulphur has been discovered within 50 miles from Matamoras, in Tamaulipas. It is from 25 to 30 feet thick, overlaid by about 6 feet of soil and high in sulphur contents.

**SOUTH AFRICA.**

An amalgamation plan is under consideration embracing the Crown Reef, Robinson Central Deep, Crown Deep, South Rand, Langlaagte Deep, and Paarl Central companies. The merger when completed will render the new company the largest gold-producer in South Africa.

Oil fields are reported in the Zwartkops valley, where the geological conditions are analogous to those of the oil fields of Boryslan, in Galicia.

There is an increasing demand for cheap labor on the Rand. The number of Chinese has been decreased by 19,163 since January last year, and although this loss has been met by an increase of 21,078 in the number of natives employed, many more are required owing to the expansion of the mining industry. The mine owners are endeavoring to procure natives from Cape Colony, Natal, and Zululand.

## COMPANY NOTES.

The directors of the Cobalt Central Mines Company have declared a quarterly dividend of 2 per cent. on the capital stock issue of the company, payable February 1st, 1909, to stockholders of record at 3 o'clock in the afternoon of January 15th, 1909.

The annual meeting of the Crown Reserve Mining Company will be held in the hall of the Sailors' Institute Building, No. 2 Place Royale, Montreal, on Wednesday, January 13th, 1909, at 11 o'clock a.m. The secretary has sent out proxies naming John Carson, W. I. Geer, J. G. Ross and J. T. R. Laurendeau for the powers of substitution to vote.

The British Canadian Asbestos Company, Limited, has declared an initial dividend of 1½ per cent. for the quarter, to be paid January 27th, to stockholders of record January 20th, 1909. This places the stock on a 6 per cent. dividend basis.

Bonds of this company to the amount of \$700,000 have recently been placed in London through H. H. Melville, of New York and Boston, assisted by McCuaig Bros. & Co.

The company has a capital of \$1,000,000, and an authorized issue of \$1,500,000 of 5 per cent. bonds, of which \$1,000,000 have been issued. The directors are the Hon. Robert Mackay, E. B. Greenshields, Wm. MacMaster of Montreal, Henry M. Whitney of Boston, Harry A. Berwind and Howard E. Mitchell of Philadelphia. The company owns 879 acres of land located at Black Lake, in the Province of Quebec.

Earnings of the company have been of a satisfactory character, and it is estimated that the earnings for the year will be equal to 12 per cent. on the capital stock.

At a meeting of Le Roi Rossland Mining Company the chairman stated that the profits for October and November amounted to £14,000. The policy being pursued was approved of by the shareholders, as the directors held in their favor proxies representing more than half of the capital. As to prospects of paying dividends, they said they were bound to go on developing for some time. The report was adopted.

The directors of the British Columbia Copper Company intend to resume the payment of dividends early during the coming year. The company declared its initial quarterly dividend of 25 cents per share and an extra disbursement of 15 cents a share, or a total of 40 cents a share on July 18th, 1907. The directors are in favor of paying 2 per cent. bi-monthly or 12 per cent. a year.

A dividend of 2 per cent. on the preferred shares of this company for the quarter ending December 31st, 1908, has been declared, payable on January 15th, 1909, to shareholders of record of December 31st, 1908. The transfer books for preferred shares will be closed from the 1st to the 5th of January, both days inclusive.

Kerr Lake declared a dividend of 4 per cent, or 20 cents a share, payable March 15th. Books close March 1, and re-open March 15th. In November a dividend of 3 per cent. was declared.

Gross earnings of the Dominion Iron & Steel Company for the twelve months of 1908 are shown in the following table:—

|            |              |
|------------|--------------|
| 1905 ..... | \$460,845 54 |
| 1906 ..... | 1,406,305 78 |
| 1907 ..... | 2,247,536 45 |
| 1908 ..... | 2,613,815 66 |

Operations of the Dominion Iron & Steel Company during 1908 follow:—

Production—Ore mined, 556,000 tons; stone quarried, 304,000 tons; coal consumed, 840,000 tons; pig iron made, 263,000 tons; steel made, 279,000 tons; rails made, 153,500 tons; wire rods made, 41,500 tons; other steel products, 35,000 tons; sulphate ammonia, 3,000 tons; tar, gallons, 4,000,000.

Shipments—Pig iron, 18,000 tons; steel blooms, 32,500 tons; wire rods, 44,500 tons; steel rails, 50,000 tons; sulphate ammonia, 2,600 tons; granulated slag, 18,000 tons. Total, 265,600 tons. Tar, gallons, 4,500,000.

## STATISTICS AND RETURNS.

### DOMINION COAL COMPANY, LIMITED—OUTPUT 1908.

No. 1, 531,490 tons; No. 2, 697,860; No. 3, 341,059; No. 4, 418,839; No. 5, 641,794; No. 6, 220,120; No. 7, 126,580; No. 8, 196,082; No. 9, 345,665. Total, 3,519,489 tons.

Shipments from the collieries of the Cumberland Railway & Coal Company, Springhill, N.S., for the month of December, 1908; were 29,808 tons.

### THE CROW'S NEST PASS COAL CO.'S OUTPUT, 1908.

|                   | Coal.<br>tons.   | Coke.<br>tons. |
|-------------------|------------------|----------------|
| January .....     | 93,364.14        | 23,787.14      |
| February .....    | 89,609.07        | 19,897.07      |
| March .....       | 81,708.05        | 21,713.16      |
| April .....       | 70,444.00        | 19,022.15      |
| May .....         | 64,701.16        | 16,110.15      |
| June .....        | 96,212.16        | 26,407.00      |
| July .....        | 99,138.07        | 31,742.00      |

| November .....    | 78,976.05        | 21,582.09      |
| December .....    | 78,323.00 (Est.) | 25,000.00      |
| Total .....       | 986,229.12       | 269,944.05     |
| Total, 1907 ..... | 981,939.00       | 231,368.00     |

Gold output at the Transvaal mines last month, as estimated by Kaffir houses in London, was 635,000 ounces, another high record. If this estimate is correct, December outturn of gold was 13,000 ounces greater than that of October, the previous record. Comparison of value of the month's output is:—

|                                 |                                 |
|---------------------------------|---------------------------------|
| December, 1908.....\$13,495,000 | December, 1907.....\$12,393,000 |
| November, 1908.... 13,048,000   | December, 1906.... 11,685,000   |
| October, 1908..... 13,120,000   | December, 1905.... 9,166,000    |
| September, 1908.... 12,481,000  | December, 1904.... 7,694,000    |
| August, 1908..... 12,484,000    | December, 1903.... 6,075,000    |

The record of silver prices in New York is as follows:—

| Year.      | High. | Low. |
|------------|-------|------|
| 1908 ..... | 58¾   | 47¾  |
| 1907 ..... | 70¼   | 53¾  |
| 1906 ..... | 71¾   | 62¾  |
| 1905 ..... | 65½   | 55   |
| 1904 ..... | 62    | 63¾  |
| 1903 ..... | 61¾   | 47   |
| 1902 ..... | 56½   | 47   |
| 1901 ..... | 64    | 64¼  |
| 1900 ..... | 65½   | 58¾  |

The silver production of Mexico for the fiscal year, 1907-08, as 2,153,014 kilograms, valued at 85,466,904 pesos. Of gold Mexico produced 28,572 kilograms, valued at 38,096,661 pesos.

The total value of the year's production of silver and gold was 124,543,565 pesos.

### BRITISH COLUMBIA'S ORE SHIPMENTS.

Th total ore shipments from south-eastern British Columbia, for 1908, in small part estimated, are 2,066,892 tons. For 1907, the figures were 1,671,206 tons—455,586 tons increase, or 28.27 per cent.

The 1908 shipments were made up thus:—

#### Ore Shipments.

|                           |                 |
|---------------------------|-----------------|
| Boundary. . . . .         | 1,476,147 tons. |
| Slocan-Kootenay . . . . . | 294,824 tons.   |
| Rossland. . . . .         | 295,921 tons.   |
|                           | 2,066,892 tons  |

#### Smelter Receipts.

|                             |                |
|-----------------------------|----------------|
| Granby . . . . .            | 1,049,671 tons |
| B C. Copper Co. . . . .     | 364,945 tons   |
| Dominion Copper Co. . . . . | 21,872 tons    |
| Marysville. . . . .         | 5,730 tons     |
| Trail. . . . .              | 332,562 tons   |
| Le Roi . . . . .            | 85,314 tons    |

1,860,094 tons

\*Includes shipments from City of Cobalt (Cobalt), 62 tons, and Nancy Helen (Cobalt), 72 tons.

The principal Boundary shippers were:—

|                       |                |
|-----------------------|----------------|
| Granby. . . . .       | 1,049,671 tons |
| Mother Lode . . . . . | 302,069 tons   |
| Oro Denoro . . . . .  | 57,286 tons    |
| Snowshoe . . . . .    | 44,502 tons    |
| Rawhide. . . . .      | 10,740 tons    |
| Brooklyn. . . . .     | 6,800 tons     |
| Sunset. . . . .       | 3,802 tons     |

Chief among the Rossland shippers were:—

|                                |              |
|--------------------------------|--------------|
| Centre Star . . . . .          | 177,389 tons |
| Le Roi . . . . .               | 76,967 tons  |
| Le Roi No. 2 . . . . .         | 28,871       |
| Le Roi No. 2, milled . . . . . | 11,270       |

The leading Slocan-Kootenay shippers were:—

|                                    |              |
|------------------------------------|--------------|
| Whitewater. . . . .                | 1,047 tons   |
| Whitewater Deep . . . . .          | 1,027 tons   |
| Whitewater Zinc (Okla.) . . . . .  | 6,800 tons   |
| Whitewater Zinc (Europe) . . . . . | 350 tons     |
| Whitewater Deep, milled . . . . .  | 30,600 tons  |
| St. Eugene . . . . .               | 25,000 tons  |
| St. Eugene, milled . . . . .       | 145,000 tons |
| Queen. . . . .                     | 1,063 tons   |
| Queen, milled . . . . .            | 11,850 tons  |
| Blue Bell . . . . .                | 2,152 tons   |
| Blue Bell, milled . . . . .        | 21,500 tons  |
| Granite-Poorman, milled . . . . .  | 10,800 tons  |

In considering the appended table it is to be noted that progress is evident in the production of everything except

lead and placer gold. Although more copper was produced in 1908 than in 1907, yet the drop in price that that metal suffered caused the principal loss to the mining industry of British Columbia. Had the price of copper held steady, this year's total value of mineral production would have exceeded \$26,000,000.

TABLE SHOWING AMOUNT AND VALUE OF MINERAL PRODUCTS FOR THE YEARS 1907 AND 1908.

| Mineral.            | 1907.      |              | 1908.      |              |
|---------------------|------------|--------------|------------|--------------|
|                     | Quantity.  | Value.       | Quantity.  | Value.       |
| Gold, placer, oz..  | 41,450     | \$828,000    | 34,100     | \$682,000    |
| Gold, lode, oz. .   | 196,179    | 4,055,020    | 256,000    | 5,291,520    |
| Total gold, oz.     | 237,629    | \$4,883,020  | 290,100    | \$5,973,520  |

### COBALT ORE PRODUCTION.

Estimated Value for Three-Quarters of 1908, and for the Year 1908.

Branches at COBALT and LATCHFORD, in the silver mining camp of New Ontario.

## WAY'S POCKET SMELTER

A practical device for testing ores—absolutely reliable. Everything necessary goes with each outfit. Tells in ten minutes whether ore carries "Values."

Tests sulphides, tellurides and refractory ores—at a cost of 5c. for each test.

Write for illustrated descriptive pamphlet.

**Way's Pocket Smelter Co.**

**P. O. Box 945      South Pasadena, Cal.**

## Wanted—At Once

**Canvassers for THE CANADIAN MINING JOURNAL.**

Applicants must be active men who have had some experience in soliciting subscriptions. Apply by letter or in person at

**Rooms 312-313, Confederation Life Bldg.,  
TORONTO, ONT.**

**Molybdenite, Graphite, Iron Oxides  
Manganese, Mica, Quartz Crystal,  
Corundum for the English market;  
also a copper mine cheap.**

**Box 60,**

**Canadian Mining Journal,  
Confederation Life Bldg.,  
TORONTO.**

## WANTED

**Copy of CANADIAN MINING REVIEW,  
January, 1907, and May 16th, 1896.**

Anyone having a copy of those issues,  
kindly communicate with the

**"CANADIAN MINING JOURNAL."**

## The Canadian Laboratories

**Chemical and Physical tests  
of all Materials.**

✧

**Mining properties examined  
and reported upon.**

✧

**Write for prices for  
Ore analysis.**

✧

**37 Melinda St.      Toronto**

# Some Books of interest on Mining to be had from the Book Department of the Canadian Mining Journal, Toronto, Ont.

**The Copper Mines of Lake Superior.** By T. A. Rickard. An attractive volume of 165 pages, handsomely illustrated. The present work consists of a group of interesting articles in a revised and amplified form, which were originally published in the columns of *The Engineering and Mining Journal* during the latter part of 1904. Octavo, cloth. Price, \$1.00.

**The Chemistry of Cyanide Solutions Resulting from the Treatment of Ores.** By J. C. Clennell. Price, 2.50.

**Across the San Juan Mountains.** By T. A. Rickard. A graphic description of a picturesque ride of 400 miles on horseback through the San Juan Mountains in South-western Colorado. The work is written in vigorous and buoyant style, and the information contained therein, while appealing specifically to the geologist, prospector, and mining engineer, will also prove of great interest and enjoyment to the general reader. Small quarto, cloth, ornamental covers and profusely illustrated. Price, \$1.00.

**A History of Cobalt.** During the summer of 1907 the Canadian Mining Journal published a beautiful illustrated souvenir volume. Included in this volume is a history of the early days of Cobalt. An excellent map of the district accompanies the book. Price, \$1.00.

**Mineral Resources of Canada.** An illustrated handbook giving a brief outline of the economic minerals of Canada, and sketching the mineral resources of each province. The book contains 140 pages, 32 color engravings of the most important minerals. The latest mineral Resource Map of the Dominion, showing the chief mineral deposits, is also included. No such work has been attempted in Canada before. This volume should be in the hands of every one interested in the mining industry. The price of this volume is extremely moderate. \$1.00.

**Minerals and How They Occur.** By Willet G. Miller, Provincial Geologist, a volume of 250 pages, illustrated. This book is especially adapted to the prospector for minerals, as he must have a knowledge of mineralogy before he can properly understand the character of rocks and the effects which are produced on them by atmospheric and other agencies. If you are a prospector this is the work for you. Price, \$1.00.

**The Sampling and Estimation of Ore in a Mine.** By T. A. Rickard. Sampling and mine valuation are eminently practical subjects, and in this work they are handled in detail by engineers and experts of the first rank, who have had world-wide experience in these matters. To students, mine directors, mining engineers, mine investors, and engineers generally, this volume will be found extremely useful. Octavo cloth, profusely illustrated. Price, \$2.00.

**Rocks and Rock Minerals.** By L. V. Pirsson, Professor of Geology in Yale University, 414 pages, 74 figures, 36 full-page half-tone plates. Not all mining men have an intimate knowledge of petrology, or the science of rocks. Even those who have had the advantage of a college course find that only a small residue of what they learned adheres to them. Most text-books on the subjects are cast into forms that repel the lay reader. Hence it is not easy for the beginner to acquire the rudiments of the science. "Rocks and Rock Minerals" is an attempt to present the outlines of petrology in such a way as to give an intelligent idea of the subject to readers quite unacquainted with the microscopic standpoint. Rocks and rock minerals are dealt with entirely from a megascopic, or practical outdoors, point of view. The book before us attains the desired object of giving the reader a knowledge of rocks and rock minerals without recourse to the microscope. It is a very fair introduction to the study of geology generally. Part III., in which igneous, stratified, and metamorphic rocks are described, is an excellent treatise in itself. Simplicity is the keynote of the book. Cloth. Price, \$2.50 net.

**The Electric Furnace.** By Alfred Stansfield, D.Sc., A.R.S.M., Professor of Metallurgy, McGill University. There has long been need of a good book on electric furnaces. The increased importance of the subject and the great value to metallurgy makes this book most timely. 211 pages (illustrated) 6 x 9 inches. Price, \$2.00.

**Simple Mine Accounting.** By David Wallace. A neat compact description of the simple methods of keeping mine accounts. Mr. Wallace is an expert mine accountant and in this book he outlines briefly and simply the kind of accounts and records which a small mine should keep. 64 pages, 6 x 9 inches, with bookkeeping forms. Price, \$1.00.

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## THE OFFICIAL MINING DIRECTORY OF MEXICO. 1908-1909

CALLE DEL ELISEO, 37, MEXICO, D. F.

**EDITORS: JOHN R. SOUTHWORTH, F.R.C.S. and PERCY C. HOLMES.**

"The Official Mining Directory of Mexico" is the 10th volume of the series of works, devoted to the propagation of knowledge concerning the resources of Mexico, which has been issued from these offices under the authorization of the Mexican Government; each copy being duly impressed with the Federal Seal of the United States of Mexico.

The contents of the work comprise:

Alphabetically listed descriptions of over 1,500 Mining companies operating over 7,000 mining properties in Mexico. Only such companies as employ more than 20 men, or use power other than animal power, are listed.

The data given, in respect to these companies, is exemplified in the specimen shown on this sheet. It includes name of company, home office address, mine office address, president, secretary, treasurer, directors, manager, superintendent, subordinate staff, where and when incorporated, capitalization, issued stock, par value of shares, additional financial data, names of mines, number of claims, product, description of ore, description of geological formation, kind of power used, number of horsepower used, description of mine workings, capacity of treatment plant, cyanide plant, smelter, etc., number and weight of stamps, number of grinding mills, number of tube mills, number of concentrators, number of men employed, contemplated improvements, general remarks.

The volume is illustrated by over 200 photographs and maps, showing the leading mines, mills, smelters, and camps in the Republic.

Tables of utility to mining men, shippers and investors are given.

A Spanish-English glossary of Mining Terms makes the translation of letters from Mexican miners possible, where a dictionary would be valueless.

Preliminary to the actual directory, there are special articles, written by competent Mexican and foreign authorities, on:

"The History of Mining in Mexico."

"Number and Geographical Distribution of Mines in Mexico."

"Foreign Investments in Mexican Mining Securities."

"Progress of the Metallurgy of Gold and Silver in Mexico."

"The Mexican Mining Chamber."

"The Mexican Mining Laws."

"The International Bureau of American Republics."

The edition presented to your notice is in English, and contains 280 pages, measuring 13 inches by 10 inches, bound in chocolate colored cloth, with the title in gold lettering on side and back. Type and paper are of the finest quality. Price, \$5.00, U.S. Coy., £1 1s. 0d. stg., M22., \$10.00, Mex. Coy., Frs. 25, postpaid.

**Copies of this excellent work may be had from the Book Department of Canadian Mining Journal, Toronto**

# Ontario's Mining Lands

---

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

## Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is \$5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only \$2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, \$10.00 per acre, and on lands situate less than 20 miles from such a railway, \$20.00 per acre.

Superficial products and building materials are sold \$2 and \$1 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed

lands; work must be bona fide begun within two years and \$500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of \$10.00 and a rent of \$1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts.

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

**The Hon. Minister of Colonization, Mines and Fisheries**  
Parliament Buildings, Quebec.

# The Crow's Nest Pass Coal Co. LIMITED

## OFFICES

**Manning Arcade, Toronto**  
**Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

## Our Analyses Speak for Themselves.

**CHAS. SIMISTER,**  
General Superintendent.

**J. D. HURD,**  
General Manager.

# WHY IS IT

THAT SALES OF

## MORTON'S

# "B C"

## Drill Steel

ARE INCREASING EVERY DAY?

MUST BE IT IS BETTER MATERIAL,

## Gives Best Satisfaction

AND THE DRILL

## Lasts Longer.

COULD ANYONE EXPECT MORE?

## Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

**W. W. CORY, Deputy of the Minister of the Interior**

# Montreal Steel Works, Limited

OFFICE AND WORKS :

St. Patrick St.. Montreal

## MANUFACTURERS

of Steel Castings of all kinds, Springs, Frogs and Diamond Crossings

*We make a specialty of*

## Manganese Steel Castings

*for Mining purposes.*

AGENTS FOR

THOMAS FIRTH & SONS, Limited

"Speedicut" high speed steel, tool steel, axe steel, saw steel, files, etc. A large stock carried in our Montreal warehouse.

Also Agents for Barrow, Haematite Steel Company, of Barrow in Furness, England.

Steel Rails of all kinds, Fish Plates, etc.

# RAMPART CEMENT

Perfectly Sound. Never swells or bursts.

Reliable for all purposes for which hydraulic cement is used.

Fineness 92 per cent. through a 200 mesh sieve.

Strength up to standard specifications, and permanent.

Used by the leading Mining Companies of the Maritime Provinces.

## Sydney Cement Co., Ltd.

*Rampart Brand*

**SYDNEY, NOVA SCOTIA, CANADA**

# "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

Leaving superior efficiency  
out of the question

two points strongly favoring Westinghouse motor-driven mine hoists and other apparatus, are the flexibility of location and simplicity of connection to the service supply, requiring only small wires, which may be readily located and extended or moved, with little trouble, as frequently as desired.

Westinghouse Motor Driving Leyner Mine Hoist.

## The Repair Economy

for which **Sullivan Drills** are noted is due to unceasing care and study spent upon their construction.

For example, the rifle bar and ratchet head, on which depend the proper rotation of the drill steel and the "mudding" of the hole, are milled from one solid bar of steel, and hardened in oil. Steel rollers engage curved ratchet faces and bear against pockets in the hardened steel collar. This device is much more durable than the teeth and pawls sometimes used. Catalogue 660.

## Corliss Steam Driven Air Compressors

Corliss Steam Engine of a Rand Air Compressor.

The efficiency of the Corliss Steam Driven Air Compressor in fuel consumption, automatic regulation and smooth action is generally conceded by the engineering world. By reason of its strength, durability and reduction of clearance losses to a minimum when running at speeds permissible in air compression, the Corliss engine is especially adapted as the power end of an air compressor.

Designed to fill the demand for an air compressor of the highest possible efficiency, our Class "BB-3" is producing results in actual operation which we can confidently place in comparison with those of any other machine now in the market. We feel that the compressors of this type which we have running in the various industrial and mining centres of Canada are the best testimonials which we have of our success in the production of air compressor efficiency.

# DRY CONCENTRATION

## Absolutely Dustless The Behrend System

The Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor.

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

Write us for descriptive pamphlet. Forward sample of your ore for preliminary test.

Canadian Behrend Dry Concentrator Co. Ltd.

OFFICE, Citizen Building, OTTAWA, ONT.

Test Plant, 48½ Inspector Street, Montreal, Canada.

## The Canadian Mining Journal

With which is incorporated the  
"CANADIAN MINING REVIEW"

Devoted to Mining, Metallurgy and Allied Industries in Canada

Published fortnightly by the

**MINES PUBLISHING CO., LIMITED**

Head Office - - Confederation Life Building, Toronto.

Branch Offices Montreal, Halifax, Victoria, and London, Eng.

Editor:

J. C. MURRAY, B.A., B.Sc.

**SUBSCRIPTIONS**—Payable in advance, \$2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, \$3.00 a year.

Advertising copy should reach the Toronto Office by the 8th, for the issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

### CIRCULATION.

During the year ending with March 1st, 1908, 91,750 copies of "The Canadian Mining Journal" were printed and distributed, an average of 3,822 per issue.

"Entered as second-class matter April 23rd, 1908, at the post-office at Buffalo, N.Y., under the Act of Congress of March 3, 1879."

### SPECIAL CONTRIBUTORS.

**Geology:** Dr. Frank D. Adams, McGill University; Dr. A. E. Barlow, late of Geological Survey of Canada; Professor Willett G. Miller, provincial Geologist of Ontario; Dr. J. E. Woodman, Dalhousie University, Halifax, N.S.

**Chemistry:** Dr. W. L. Goodwin, Director School of Mining, Kingston, Ontario; Milton Hersey, M.Sc., Official Analyst Province of Quebec.

**Mineralogy:** Professor W. Nicol, School of Mining, Kingston, Ontario.

**Mining:** S. S. Fowler, M.E., Nelson, B.C.; Frederick Keffer, M.E., Anaconda, B.C.; A. B. Willmott, M.E., Sault Ste. Marie, Ont.; J. C. Gwillim, M.E., School of Mining, Kingston, Ont.; J. Obalski, Inspector of Mines, Quebec; J. Bon-sal Porter, M.E., McGill University; H. Mortimer-Lamb, Sec. Can. Min. Inst.; John E. Hardman, M.E., Montreal; Fritz Cirkel, M.E., Montreal; George W. Stuart, M.E., Truro, N.S.

**Metallurgy:** Stafford F. Kirkpatrick, School of Mining, Kingston, Ontario; A. P. Scott, Dominion Iron & Steel Company, Cape Breton.

**Natural Oil and Gas:** Eugene Coste, M.E., Toronto, Ont.

## JUSTICE.

Whatever delays and dallyings there may have been in bringing to justice the perpetrators of the Highland Mary-Lucky Boys-Blue Bell group of swindlers, there is satisfaction in recording that the integrity of the law has at last been vindicated. On Saturday, Jan. 16, 1909, Frank Law, one of the chief promoters of these swindles, was adjudged guilty by the jury of the Court of General Sessions. Later, on Jan. 26th, he was sentenced to five years in Kingston Penitentiary by Judge Winchester.

Here, so far as we are concerned, the history of Frank Law closes. We derive no satisfaction from the fact that a fellow citizen has brought disgrace and suffering upon himself and his family. But we are convinced that the whole sordid story will act as a deterrent upon others who may look upon the flotation of bogus mining companies as a legitimate source of wealth.

In considering the history of mining company promotion there are two features that obtrude themselves most unpleasantly. The first is that, almost without exception, the worst of these schemes were those that advertised most extensively in several of the daily newspapers. Looking over the columns of the Toronto World for 1907 we notice thirty large advertisements (including those of Law & Company). Five of the promoters of these concerns are now fugitives from justice. The shares of not one of the thirty companies are worth purchasing to-day. This is indeed a startling indictment.

The second feature that demands remark is the aid given to all of the most unsavory fakirs by members of the legal profession, a profession whose honorable traditions are out of all keeping with this discreditable practice.

It is fair to argue that a promoter's legal adviser has more than usual opportunities of acquiring inside knowledge of the moral standing and business methods of his client. How then can there be justification for a lawyer lending his own or his firm's name to the most egregious schemes for robbing people who happen to have confidence in that name? Has the lawyer no duties as a citizen? Do his legal attainments necessarily place him beyond the pale of the moral code?

Frank Law was not the only malefactor in the case that has just been brought to a conclusion. Equally guilty were Russell, and, probably, Abendroth. But the history of the case reveals the fact that there was an intimate connection between the office of Lennox & Lennox, barristers, and the operations of Frank Law & Company. One member of the former firm was president of Silver Bird. Another was discovered to

be the author of the famous "Michael Macdonald Report" on Highland Mary.

We believe that the great bulk of practising lawyers in Toronto, and, indeed, in Canada generally, would refuse utterly to touch such promotions as those alluded to above. We also believe that no members of the profession should be allowed to bring it into evil repute by making easy the path of the mining fakir.

Similarly it should be impossible for any newspaper to become the incubator of swindles without losing its fair name.

---

## REPORT ON THE MINING AND METALLURGICAL INDUSTRIES OF CANADA.

When it was announced about two years ago that the Mines branch of the Department of Mines, Ottawa, had received instructions to collect and publish full information concerning the mining and metallurgical industries of Canada, few people had any conception of the magnitude of the work. Whilst it was universally acknowledged that some attempt to present in accessible and compact form the mass of data obtainable, the impression was current that this would not necessarily consume more than six or eight months. However, the event has proved that a practically complete description of the mining and metallurgical activities of Canada requires a volume of 972 pages, embodying the labors of a large special staff over a period of at least eighteen months.

The bulky volume before us is not, however, to be taken as the final and definitive result of two years' labors. Whilst in its present form it is undoubtedly valuable, it will prove of but ephemeral interest unless revised editions are brought out periodically. Hence, this report may be regarded as providing not only present information that will prove of business value to all classes of investors, but as forming a working basis for an annual publication that will provide an immensely useful source of reference. And this, we believe, is in accordance with the plans of the Department of Mines.

In view of the large sums of money expended in the preparation of this report the Department has decided to fix its price at one dollar per volume. This nominal price will deter no one interested in the mining industry from securing a copy. It will have the effect also of preventing irresponsible persons from trespassing upon the generosity of the Department.

It is probable that had the various operating companies been grouped by industries instead of by territorial divisions, the report would have been more compact and even easier of reference. This is, however, not a matter that detracts seriously from the publication. No doubt the former plan would have been more costly and, under present circumstances, less complete.

We may also suggest that an arrangement whereby the general information is thrown together in the first part of the volume, and all data as to the personnel of

directorates, etc., placed in smaller type at the back of the report, would render the bringing out of new editions much less laborious.

On another page we print a more complete notice of the report. Here, however, we may place upon record our belief that the appearance of this comprehensive review of Canada's mining and metallurgical industries is an event of prime significance. Following last summer's efforts of the Canadian Mining Institute it should make our country's resources known all over the world.

We congratulate the Minister of Mines and the officers of the Department upon a monumental work achieved.

---

## FEES AND THE MAN.

Except under extraordinary circumstances it is bad business for the mining engineer to work openly for small or nominal fees. We need not reiterate here all the reasons that justify the consulting engineer in charging substantial amounts for his time and services. It will suffice to mention that in his advisory capacity the mining engineer assumes large responsibilities. His periods of employment are not continuous. Often he may suffer long periods of idleness. Hence, it is consistent neither with his actual needs nor with his professional dignity that he should work for insufficient fees.

A Montreal mining man, ostensibly a mining engineer, advertises in a daily paper the fact that he gives free advice on Cobalt mines and stocks. If one thing is more certain than certainty itself it is that advice thus offered is not worth taking. As to what returns for his trouble the alleged mining engineer expects we may venture a shrewd guess. What his confiding clients must receive will prove an exact equivalent of what they give.

---

## THE MINING ENGINEER'S REPORT.

As to what a mining engineer's report should contain there is a wide divergence of opinion. Some there are who contend that the mining engineer's opinion is the essential element. They argue that, since the mining engineer is a trained specialist, therefore his conclusions, drawn from careful examination of any mine or prospect, are the whole soul of the report.

The subject is one that requires handling with gloves; but there can be no harm in glancing at the other side of the question.

To a person totally unacquainted with mines and minerals, the interior of a mine is much the same as an inordinately large cellar. Unless his eye is caught by the actual glint of gold, or by some other such arresting phenomenon, he carries away merely an impression of gloom. Not only is he unable to interpret the very features that appeal to the mining engineer, but he is

actually incapable of observing them. To a greater or less degree this is true of all untrained persons, from the honest miner down to that worst product of the devil, the "mining expert." Long training, keenness of vision, scrupulous honesty, and adequate experience are necessary to qualify a mining engineer to *observe* the geological, mineralogical, and other facts, and to record them properly. To see in their true light the *facts* concerning labor, transportation, market, water, fuel, timber, and the multitudinous other factors that affect all mines, is by no means an easy task. To write of what his professional training has enabled him to see, is even harder. For the engineer is called upon not to disguise his thought in the cheap jargon that the "mining expert" employs on his victim as an anaesthetic. He should set down his facts so clearly, so fully and so accurately that they will be intelligible to any educated man of business.

It is highly probable that the engineer who is able to write such a report as that outlined above, is the person best qualified to draw logical conclusions from the facts recorded. And the engineer's opinion is naturally, that part of the report that is considered most valuable by his clients. But the best opinion has in it more or less of human error. Faulty logic may mar an otherwise unexceptionable document. The "mining expert's" deal with a minimum of fact and a maximum of opinion. The mining engineer owes it to himself and to his clients to present not only his opinions, but also the grounds upon which his opinions are based. Then his recommendations will stand upon their own merits, and not upon the unsafe foundations of professional prestige and public ignorance.

### SUFFERING CANADA.

When, not long ago, President Roosevelt organized his famous Annanias Club, membership in which was entirely voluntary, the persons whom he singled out as charter members were the nature-fakirs.

Lately an enterprising magazine has been corraling a bunch of "Canada-fakirs," writers who toy with snow and thermometer at the expense of the Canadian climate. Ignorance and the exigencies of modern novel manufacturing do not justify the practice of libelling our country. There is ample color in facts and there is no difficulty nowadays in obtaining facts.

Except for occasional magazine writers who sometimes select a misty mine as a background and who make as many breaks as space will permit, the mining industry has suffered little at the hands of fictionists. The most that can be said of casual writers about the mineral wealth of the Dominion is that the knowledge behind their allusions is inadequate; even if the writers' goodwill is undoubted.

A case in point is furnished by Miss Agnes Laut, whose "Conquest of the Great Northwest" has recently been published. The book describes the explorations

that began with Hudson's voyage of three hundred years ago, and is based mainly upon Hudson Bay Company records, some of which are brought to light for the first time by Miss Laut.

The Company made several attempts to discover minerals. The expedition of Captain Knight, in 1719, perished on Marble Island, in the northwest part of the Bay. Samuel Hearne's trip to the Coppermine River, in 1770, brought fame to him but no dividends to the Company. Other rumours of minerals on the interior were not regarded seriously. Miss Laut refers to them: "There were legends, too, at Moose and Rupert of great silver mines [what is a mine?] toward Temiscamingue—the field of modern cobalt beds." . . . "How true some of these legends were has been proved by the great cobalt mines of Modern Ontario."

No reader of Miss Laut could suppose that silver is being mined in the Temiscamingue. She evidently supposes that only cobalt is found at Cobalt, and, also, that cobalt is something akin to peat or asphalt. "Cobalt beds" is a delightfully feminine description. Imperfectly informed persons, who have heard of Cobalt, might even believe that Miss Laut wishes them to understand that there is no silver in the district. It is to weep that Canadian writers at least do not give the whole truth about matters on which they write with every assurance of authority.

There can be no fair complaint to-day either of lack of authentic information concerning Canada, or of dearth of inspiration in the history of the Canadian nation. The story of the Hudson Bay Company is romantic enough to satisfy the most imaginative. And, coming down to our own times, there is no better reading to be found than many of the records of explorations conducted by Canadians. Take, for instance, Dr. Low's "Cruise of the Neptune," a simple, direct narrative of adventure in our northeastern sub-arctics; or J. W. Tyrrell's "Across the Sub-Arctics of Canada." Both these books should be available to every school child. Mr. Tyrrell's book, descriptive of an arduous journey undertaken by himself, and his brother, Mr. J. B. Tyrrell, is a straightforward, unornate story of adventure in the great barrens of northwestern Canada and the Hudson Bay region. In due time it will be looked upon as a classic, not alone because we know it to be scientifically accurate, but also because it is as entertaining as the best novel. At present the Canadian public is content to assimilate silly libels on its climate and resources, dished out by persons whose knowledge of the country is both inaccurate and scanty.

An important witness in giving evidence before the Royal Commission on safety in mines, declared himself to be opposed to frequent inspection of collieries. The Government inspector, he contended, should always be equal or superior to a manager. The working-man grade of inspector would be an anomaly.

**EDITORIAL NOTES.**

The Eleventh Annual General Meeting of the Canadian Mining Institute will be held in Montreal, at the Windsor Hotel on the 3rd, 4th, and 5th of March, 1909. The list of papers to be presented is already large and is being added to from day to day. Information as regards railway arrangements, etc., appears on another page in this issue. We commend it to the careful attention of our readers.

Mr. J. B. Tyrrell has been advised of his election as corresponding member of the Council of the Institution of Mining and Metallurgy, London, England. This is a signal honor. The Institution of Mining and Metallurgy is the most carefully organized body of its kind. Membership is only attainable by professional men of high standing, unblemished reputation and a long record of practical service. Election as corresponding

member of the Council is, of course, a still higher honor.

The Cobalt representative of Beer, Sondheimer & Co., 42 Broadway, New York, has drawn our attention to an inaccuracy that occurred in our issue of January 15th. In that issue the shipments of ore to Germany were reported as being about 140 tons of low-grade ore. These figures were hastily prepared and, in this case, were inadequate. Beer, Sondheimer & Co., during 1908, contracted for and shipped 200 tons of high-grade ore from the Temiscaming & Hudson Bay Co.; 150 tons high-grade ore from Kerr Lake; 60 tons high-grade ore from Crown Reserve; and 60 tons high-grade from Silver Cliff. In addition to these shipments two cars of low-grade ore were shipped from Silver Cliff.

The high-grade ore is sent to Hamburg, Germany. The low-grade goes to Norfolk, Virginia.

## SOME RECOLLECTIONS OF EARLY COPPER MINING IN CANADA.

Written for the Canadian Mining Journal by Dr. James Douglass.

The early records of copper mining in Canada tell a story of mingled success and failure, the failures unfortunately decidedly preponderating. Within the provinces of Quebec and Ontario, until the building of the Canadian Pacific and the discovery of the Sudbury Copper-Nickel ores, active mining in Ontario was confined to a group of mines on the shore of Lake Ontario, and a feeble attempt to work the native copper beds of Michipocoten Island. In Quebec the area of copper mining was confined to the eastern townships, where unquestionably large deposits of low grade copper ores of very different character exist.

The Bruce mines were discovered on the land of the Montreal Mining Co. on Lake Huron in 1846. An opening was said to have been first made upon them in 1847. The Wellington mines were shortly afterwards discovered, and opened on the lands of the same organization not far from the Bruce Mine. When active operations were undertaken John Taylor & Sons, of London, at the time the most noted of mine managers, took general charge, and therefore all the work and machinery above and below ground, were designed and conducted on the Cornish type. The veins on the Bruce and Wellington properties varied from a few inches to thirty feet in width, the mineral consisting of chalcopyrite associated with small quantities of iron pyrites in a quartz gangue. The ore was therefore admirably suited to yield a high concentrate to mechanical concentration. Returns of shipments from 1847 to 1860 show about 10,000 tons of concentrates averaging about 20 per cent. from the Bruce mines, and from 1847 to 1862 some 6,000 tons from the Wellington mines. The average of the ore mined is supposed to have been about 4 per cent. The highly acid character of the ore unfitted it for smelting, but attempts to smelt the concentrates with coal imported from Ohio were financially uneconomical. At that period the success attained by Henderson in leaching the Tharsis ore from

Spain by the Longmaid method induced the Company to attempt applying it to the Bruce ores. A M.-de-Bussy was sent from Europe to erect and superintend the operation of the plant. It was found, however, that while roasting with salt such highly sulphuretted ores as those from the Spanish peninsula chloridized very thoroughly the copper, the method was not as applicable to pure chalcopyrite in a silicious gangue. At any rate the method was speedily abandoned, and after that the mines remained idle for a long period of time. De Bussy's experiments were made about the year 1869-70.

About the same year as the Bruce mines were discovered, namely, 1846, copper was discovered in the township of Inverness, County of Megantic, in Lower Canada. Some very rich ores of erubescite were discovered at surface; considerable work was done and some shipments were made in 1849-1850 and 1851. The surface indications did not however lead in depth to either large or permanent deposits, and the Inverness mines were after 1851 abandoned. But prior to that time some ores of erubescite and bornite had been discovered on the farm of a Mr. Harvey in the 15th range of the township of Leeds. The Quebec and St. Francis Mining Company was organized in 1847 to develop this property. John Arthur Phillips, then the most noted authority in England, was sent out in 1852 to report on the property by John Taylor & Sons. He was impressed but not persuaded. Subsequently, however, English capital was enlisted, and the English and Canadian Mining Company was organized. It erected concentrating works of the Cornish type, and carried on operations for some twenty years, though during half that period the Canadian stockholders owned the whole stock of the Company. The result of their operations went to show that the rich veins which appeared at surface, though they cut across the shales of the Quebec Group, were not continuous for any long

distance, and terminated, at a comparatively shallow depth, in a bed of slate lying conformably with the strata and carrying, in seams and in disseminated particles, from  $1\frac{1}{2}$  to  $3\frac{1}{2}$  per cent. of copper. Beneath this bed, and apparently terminating in it by a fan shaped extension of its quartzite gangue, a vein—called the Fanny Eliza—was discovered with almost verticle dip, and carrying a chute of rich ore which was ultimately extracted to a depth of several hundred feet. The bed in the vicinity of these surface and deep veins averaged over 3 per cent. of copper, but the yield fell off to about  $1\frac{1}{2}$  per cent. as extraction extended beyond the points where these veins apparently entered and left the bed. The richest portions lay between, or at no great distance from the space intervening between these veins. From that area some five or six thousand tons of ore was extracted which averaged some 3 per cent. Beyond that area, where the ore apparently averaged about  $1\frac{1}{2}$  per cent., the lower grade compelled abandonment of work on the bed proper.

But work was prosecuted on the "Fannie Eliza" vein, below the bed for years, if not at a profit, yet not at a loss. The production, of course, measured by the output of our modern establishments, was insignificant, amounting to 500 tons of 20 per cent. concentrates a year.—equivalent, therefore, to only about 200,000 lbs. of metallic copper. This however, was sufficient to give the property a certain ranking, when all the mines of Lake Superior turned out only 12,000,000 pounds of copper, and the total production of the United States was only about 17,000,000 pounds.

Two other beds were cut in running a tunnel, but their value was never accurately determined. On an adjacent property the so-called "Daigle Lot" a vein of bitter spar was opened, carrying occasional grains of gold associated with bornite, but the quantity was only sufficient to raise hopes without gratifying them. The English and Canadian Mining Company was succeeded by a Scotch Company, but instead of developing its known deposits sunk its capital in looking for new ones. During the active career of the mine the concentrates had to be hauled twenty miles to the nearest station on the Grand Trunk Railway, and shipped either to England or to Baltimore. Water for concentration was collected in dams, though the south branch of the Palmer River, a stream of considerable size, was only two miles distant. It was at one time contemplated to build a tramroad from the mine to the river and there erect a concentrating plant. The more economical plan would have been to pump the water to the ore instead of hauling the ore to the water. Under these disadvantages it is almost to the credit of the mine that for a number of years it was self-supporting. This raises the question as to whether these copper-bearing beds in Leeds, Inverness, Halifax and many other localities in the eastern townships might not, with better machinery for treatment, under modern metallurgical methods, and with cheap transportation, be at some of the more favorably selected locations, worked to a profit. To all appearances there are large quantities of ore, but whether anywhere it is of a working grade can only be determined by the expenditure of more money, and so much has already been fruitlessly spent that capital has become timid. The same, however, has been true of other deposits on the continent, which were abandoned in the past for the same reason, and are today most profitably worked.

During this same early period a large body of ore was discovered at Actonvale, on the Grand Trunk Rail-

road between Richmond and St. Hyacinth. The ore—a more or less decomposed sulphide of copper—was disseminated through limestone, and in one place concentrated into a large mass which was worked very profitably by open cut from surface, and so far as published records give the figures, the Acton Mine yielded from 1859 to end of 1861—6,000 tons of 17 per cent. ore and concentrates, and during the following year about 2,500 tons of 12 per cent concentrates, which were shipped to the United States.

Meanwhile the large masses of iron and copper sulphurets near Lennoxville were discovered. The first company to work them actively was a Hartford organization, which roasted the ore in heaps and ran it down into matte. Recognizing the waste inherent in such an operation, the company erected sulphuric acid works on the south shore opposite Quebec, with a view of making superphosphates out of the apatites from the Ottawa. The intention and the enterprise thus shown were admirable, but may be assumed to have been financially disappointing, for that company and its works in time disappeared. A Montreal company applied the Hunt & Douglas wet process unprofitably. Another attempt was made by a Scotch company to leach the ores by the Longmaide-Henderson method, which we have already referred to as having been applied unsuccessfully to the Bruce ores of Lake Huron. The Ascot ores were from a mineralogical point of view admirably suited. Nevertheless the experiment was financially unsuccessful. But for years the ores of that district have at least been profitably mined and worked under the admirable management of the Nichols Copper Company, who mine the ore, utilize so much of it as can be advantageously disposed of, in making sulphuric acid on the spot, and ship the balance for chemical and metallurgical treatment to their large works at Laurel Hill, Long Island. Another United States company—Orford Company—worked one of their deposits in the seventies and erected their Orford Works, in New Jersey, to treat them. The mines are still worked by some of the same owners—but the connection of the mines with the large owners, to which they gave their name—was long ago dissolved.

#### CANADIAN MINING INSTITUTE ELEVENTH ANNUAL MEETING.

The Eleventh Annual General Meeting of the Institute will be held in the city of Montreal, on Wednesday, Thursday and Friday, March 3rd, 4th and 5th, 1909.

The Institute headquarters will be the Windsor Hotel, Montreal, and members are requested to notify the Secretary as early as possible of their intentions to attend, in order that accommodation may be reserved for them.

Application has been made to the Railway Passenger Association for special transportation privileges for members and their friends attending the meeting, and the conditions under which these will be granted are as follows:—

1. A single first-class ticket must be purchased not more than three days (Sunday not to be counted a day) prior to the opening day of the meeting.
2. A standard certificate of such purchase must be obtained from the ticket agent issuing the transportation.

3. A standard certificate must be endorsed by the Secretary of the Institute and stamped by a representative of the railways, who will be in attendance at the Secretary's office, room 3, Windsor Hotel, on the three days of the meeting at hours to be bulletined later.

4. A charge of twenty-five cents (25c.) will be assessed on each certificate.

The provisional programme of the meeting is as follows: The proceedings will be opened at 10 a.m., on Wednesday by an address from the President. The Wednesday morning, and, if necessary, the afternoon session of that day will be devoted to the consideration of business affairs to be submitted to the meeting, including the report of the Council; the Treasurer's statement and balance sheet; the proposed repeal of and amendments to the by-laws; and the election of council

for the ensuing term. A selection of papers will be read and discussed on Wednesday evening, and at the Thursday and Friday sessions.

Among those who have either definitely or provisionally promised to present papers are the following: Dr. J. F. Kemp, of Columbia University; Dr. Heinrich Ries, of Cornell University; Mr. H. P. H. Brumell; Mr. W. Blakemore; Mr. H. S. Badger; Mr. R. E. Chambers; Mr. F. Cirkel; Mr. Eugene Coste; Mr. E. T. Corkill; Mr. W. D. Craig; Mr. D. B. Dowling; Dr. B. E. Fernow; Mr. S. S. Fowler; Mr. J. C. Haas; Mr. Frederick Hobart; Mr. H. E. T. Haultain; Mr. E. B. Kirby; Dr. A. C. Lane; Mr. G. C. Mackenzie; Mr. F. C. Merry; Mr. A. J. McNab; Mr. J. C. Murray; Mr. J. Obalski; Mr. D. W. Robb and Mr. George R. Smith.

The annual dinner will be held on Friday evening at 8 o'clock.

## THE MINERALS OF NOVA SCOTIA DURING 1908.

A. S. Barnstead.

The cause of Nova Scotia's general prosperity in later years lies to a very great extent in the fact that the Province possesses extraordinary wealth in her mines, resources that are appreciated alike by Government and people. While the Government owns the minerals, yet the actual mining is left to the enterprise of private capitalists who hold their rights in leases from the government. This is a source of considerable revenue to the Province and the large increase in royalties in the last dozen years has enabled the Government to enter upon a policy of expansion along other lines.

The rental exacted by the Crown is very small. A coal lease carries with it a royalty of ten cents on the long ton, though the Province made a special arrangement with the Dominion Coal Company in 1893 for a 99-year lease whereby that company pays 12½ cents per ton royalty. Two per cent. on the gross value brings a revenue of 36 cents per ounce for unsmelted gold and 38 cents for smelted gold. Five cents per ton is what the Government exacts as royalty on iron taken from the ore beds reserved by the Government. Licenses to search are issued at the rate of \$30 for an area of five square miles in the case of minerals other than gold or silver. Leases for four renewable terms of twenty years each can be selected from them at a cost of \$50.00 each, and are subject to an annual rental of \$20.00. Licenses to search for gold cost 50 cents per area and leases \$2.00 per area, of 250 feet by 150 feet, for a term of forty years.

Though general depression has affected the coal trade elsewhere, it is only since November that its effects have been noticed in a lessened activity at the coal mines. Nova Scotia has felt the stringency less severely than might have been expected. The year for some industries has been one of arrested development, and for that reason a greater expansion, especially in the coal trade, has been prevented. A summary for the 12 months past places the mineral output of the Province at \$17,412,000. This is about \$2,000,000, in excess of the value for 1907, so that a fair degree of satisfaction is generally felt. The outlook is, however, affected by two important problems, the solution of which is looked forward to with interest. There is, first, the Privy Council decision in the Dominion Coal and Steel case, which may be announced before these words appear; and, secondly, the invasion of the St. Lawrence market by the coal companies of the

United States. This dumping process has already made inroads into Nova Scotia's natural market, and how long this American aggression will continue or what remedy will be applied to conserve the St. Lawrence coal trade to Nova Scotia is still in the future.

When a few months ago, the amount of increase in the imports of American bituminous and anthracite coal into the St. Lawrence market became known, surprise was everywhere expressed and some alarm felt lest these inroads might have a serious effect on our coal industry. There is a factor in the situation that appeals with some force to the writer. It is this: American coal men are enabled to make low contracts because owing to introduction of labor saving machinery and other causes the labor cost of a ton of coal has not increased to them. To counterbalance this Nova Scotia mines are on the seaboard—the Springhill mines being the only ones not on tidal waters, and they are but 30 miles from the shipping pier. Of course, this is no handicap in view of the long hauls that American coal companies have to contend with. Our miners are well paid, none better. If the cost of living were reduced, our miners could accept lower wages and be as well, if not better, off. What remedy is to be applied? Simply this, back to the farm! The demand for labor in the mines has been so great in the past that farmers and their sons have left the plow and the hoe to shoulder the pick and shovel. As a consequence not five per cent. of the necessities of life consumed by the mining population is produced in the neighborhood of the mines. Ontario, Quebec and Prince Edward Island are supplying produce to the colliery towns, which might easily be raised in Cape Breton, Pictou and Cumberland Counties. This process of draining the farm of its workers to supply mine labor has, within the past decade or two, practically depopulated some of the rural sections and helped to create the abandoned farm problem in Nova Scotia. Added to this, were the great opportunities thought to lie in the far fields of the Western plains. The lure of the West has been a seductive one and its captives are numbered by thousands.

What better remedy is there than to point out the harvest for the farmer and market gardener in the neighborhood of the mines, and, if our own sons do not return to the farms, to induce a satisfactory immigration that will take advantage of the opportunities. Thus will the

cost of living be reduced, and, mayhap, as a direct result, the cost of coal production. It is a matter in which all must work together. There is, indeed, greater necessity for common action in view of the American competition that has lately developed in the St. Lawrence market.

But the editor has asked for some statistics of the mining industry for 1908. The prefatory note cannot be extended. The figures given are those for the Government financial year ended September 30th last. In coal th figures for the calendar year show a slight reduction from that of the fiscal year.

In 1908 the quantity of coal raised was 6,299,292 tons, of which 5,485,583 tons were sold, 118,499 used by workmen and 496,485 by engines. It is of interest to compare the production and sales and the amount used by collieries for the last ten years.

### Coal.

#### Production and Sales by Collieries.

|            | Production. | Sales.    | Workmen. | Engines. |
|------------|-------------|-----------|----------|----------|
| 1899 ..... | 2,642,333   | 2,419,137 | 51,903   | 124,280  |
| 1900 ..... | 3,238,245   | 2,997,546 | 52,974   | 156,108  |
| 1901 ..... | 3,625,365   | 3,119,335 | 63,865   | 214,342  |
| 1902 ..... | 4,366,839   | 3,898,626 | 61,635   | 279,014  |
| 1903 ..... | 5,255,247   | 4,621,074 | 75,503   | 393,046  |
| 1904 ..... | 5,247,135   | 4,544,609 | 80,811   | 368,398  |
| 1905 ..... | 5,050,420   | 4,475,284 | 71,303   | 355,534  |
| 1906 ..... | 5,866,605   | 5,194,590 | 84,721   | 362,746  |
| 1907 ..... | 5,730,660   | 5,046,690 | 103,873  | 414,413  |
| 1908 ..... | 6,299,282   | 5,485,583 | 118,499  | 496,485  |

The figures of the increased colliery consumption in the last ten years tell better than words can express the fact that the mines are larger, requiring more ventilation, haulage and pumping and that labor-saving machinery is more extensively employed. In 1899 five per cent. of the production was used as fuel for the colliery engines; in 1908 eight per cent. went for this purpose.

The total production of coal in Nova Scotia by counties and companies is as follows:—

#### Cape Breton—

|                                |           |           |

|                                     |         | 559,013 |

#### Colechester Coal Co. ....

|  |           |
|--|-----------|
|  | 3,951     |
|  | 6,299,282 |

From the above statement it will be at once observed that the Dominion Coal Company has more than half of the output of the Province to its credit. This is greater than the previous year's product by 360,021 tons. The holdings of this company will allow a continuance of the present output for a thousand years and this is under rather than over-estimated, as it is quite impossible to make an accurate determination of the value of the submarine areas.

Eighteen thousand men found employment at the mines of Nova Scotia in 1908 and 3,000 additional men, indirectly depending on the coal industry, were engaged in railway transportation and at the shipping piers.

The great expansion of the coal industry of Nova Scotia may be judged from the fact that in the last eight years the total amount of coal sold was 36,197,653 tons. In the last ten years previous to that the total sales amounted to 20,552,526. At the same rate of increase the end of the present ten year period will see nearly two and a half times the quantity sold as in the previous decade.

The Nova Scotia Steel and Coal Company did not increase its output, though much development was done and two practically new collieries were opened that brought up the capacity of the collieries at Sydney Mines to over four thousand tons per day. Moreover, "Sydney No. 4" is now the only electrically worked colliery in the Dominion. This company is in a decidedly unique position in that it possesses collieries of its own adjoining its blast furnaces and open hearth plant for iron and steel production; at Point Edward it has its limestone quarries and at Wabana, off the Newfoundland coast, its iron mines. In the latter part of 1908 the company drove a pair of slopes or tunnels to its submarine iron ore beds and discovered a magnificent bed of ore equal in purity and greater in height than that worked on land.

The North Atlantic Collieries Company at Port Morien have entered the market this past year to some effect, having increased their output from 981 to 58,777 tons. This company possess valuable submarine areas and are working a continuation of the Blockhouse seam, noted in the past as a producer of the best gas coal.

The other companies operating in Cape Breton and Inverness Counties have all shown substantial gains in their output. The Cape Breton Coal Mining Company's colliery at New Campbellton in Victoria County has changed hands and an English lumber syndicate will hereafter operate it as a source of supply for their operations in Newfoundland. The Mabou Mines have been kept in good working condition, but no development can be recorded. In Richmond County two government drills have been at work. It is the policy of the Provincial Government to furnish a diamond or a calyx drill and keep it in repair. The prospecting company pay the expenses of its operation except where boring takes place at an extraordinary depth, when the Government may lend assistance.

The coal companies of Pictou County maintained a steady output during the year and until November there was no lack of employment.

The Cumberland Coal Company were enabled, owing to the cessation of the strike at Springhill, to increase their production by 75,093 over that of 1907. At Chignecto the Maritime Coal, Railway and Power Company have made extensive advances during the past year. A new slope has been completed to a depth of 2,400 feet and levels broken off east and west at 1,800 and 2,300 feet from which they are now getting an output. There is an up-to-date bankhead, the mine is equipped with modern machinery and the company are capable of

handling an output of 1,500 tons per day. Nearly all the other operating companies have maintained or slightly increased their previous output.

### Gold.

The gold production of Nova Scotia was less in 1908 than since 1881. The total yield was 12,000 oz. received from 59,664 tons of quartz. This yield was valued at \$237,000, an average return of \$3.96 for each ton of ore crushed. Up to September 30th, 1908, 1,974,836 tons of quartz have been crushed and the yield has been 899,887 oz. Notwithstanding it was a very dull year in production, 525 men—a larger number than in 1907—found employment in 18 different districts. The year 1909 will see greater developments, and it may be that a forward policy in respect to Government assistance to the deep gold-mining industry will be among the features of the new year to record. One-half of the total area of Nova Scotia is in gold-bearing rock. While for the past 45 years gold mining has been prosecuted with considerable success, in proportion to the outlay of labor and capital, the exploiting of this immense source of wealth has been very greatly hindered by a lack of scientific investigation and modern methods of mining. Only a limited capital was required so long as lessees were content to reap the rewards of their industry from the surface croppings. Deeper mining has yet to go beyond the early stages, though serious attempts have been made at North Brookfield by the Brookfield Mining Co. at Caribou and at Goldboro. The former mine was reopened this year past. The Baltimore-Nova Scotia Mining Company at Caribou, Halifax County, has reached a depth of 1,000 feet vertical. The largest company at work is the Boston-Richardson at Goldboro, in Guysboro County. There was crushed at the mill beneath its 950 stamps 38,600 tons of quartz. Much development work was continued and an incline shaft was run from the 400 ft. station to 700 feet and two new levels are being worked from 550 and 700 feet. This company is making good progress, warranting the large outlay of capital.

Development was also carried on at Renfrew by the Eagle Mining Company, which opened old mines, cleaned out shafts and re-timbered their property underground. The largest development, however, is to be noted at Middle River, in Victoria County, Cape Breton. There \$100,000 has been expended by the Great Bras d'Or Mining Company and they are perfectly satisfied with the result thus far secured; 28,000 tons of quartz have yielded 590 oz. of gold. They are working on an outcrop in the glen of the ravine made by the Second Gold Brook, a tributary of the Middle River. The ore contains arsenic, copper and silver, as well as gold, and there are traces of nickel. The stamping mill, crusher and every other necessary modern appliance have been erected. The mining consists in driving tunnels on the vein at the base of the hill and back stopping.

At Leipsigate, in Lunenburg County, the Micmac Company have crushed 2,692 tons and have secured a yield of 868 oz. of gold and 194 oz. of silver.

The Oldham Sterling Gold Mining Company at Oldham have reached a depth of 900 feet and have averaged during 1908 4.53 oz. per ton of quartz; 2,384 oz. have been taken out of 526 tons of quartz during the year.

At Malega Barrens, in Queen's County, the Ponhook Mining Company has cleaned out an old shaft and surface work has been carried on in preparation for greater development.

Very little has been done by the Dominion Antimony Mine at West Gore, owing to legal difficulties that have arisen.

At no other mines is there anything special to record save that the old Touquoy Mine at Moose River, Caribou, Halifax County, may, if recent rumors be correct, begin to be heard as a gold producer.

### Iron and Gypsum.

The chief reason why the rich deposits of iron ore are not mined to a greater extent than they are is that the Dominion Iron and Steel Company and the Nova Scotia Steel and Coal Company have both large beds of ore suitable for steel-making at Wabana, off the south coast of Newfoundland. Owing to the cheapness of water carriage and the accessibility of their large deposits, it does not pay to mine ore properties closer at hand. These two companies imported over 1,432,000 tons of ore in 1908. The Londonderry works have not been in steady operation owing to bad trade conditions. Development work has been carried on at Torbrook, Annapolis County, and at Arisaig in Antigonish County.

Nova Scotia deposits of gypsum are among the largest in the world and their value is becoming more widely known. Last year 230,000 tons were exported, a falling off by 100,000 tons from the export of 1907.

### Other Minerals.

Copper ores are widely spread and during late years serious attempts have been made to develop some of the more promising of them, and with very satisfactory results. The companies working at Polson's Lake in Antigonish and at Waugh's River in Colchester extended their mining operations.

The steel companies of the Province find abundant limestone in the Province to serve as a flux, and there is sufficient left to supply the world's market. Freestone and granite and other building stones were quarried in large quantities.

Twenty-three million bricks were made out of Nova Scotia clay during 1908 and many valuable clay deposits are to be found in other sections of the Province. This is specially true of a large deposit at Middle Musquodoboit, which will be developed, undoubtedly, on the construction of the Halifax and Eastern Railway Company.

The Sydney Cement Company manufactured 45,000 barrels of cement in 1908, using slag supplied by the Steel Company.

Two very valuable discoveries have been made in Nova Scotia in the last year, both of them in Halifax County. A deposit of galena carrying silver has been found on the Meagher's Grant road about two miles from the head of Musquodoboit Harbor. The interest in this discovery may be judged from the fact that over 800 areas have been taken out at the Government Mines Office.

At Moose River, near Middle Musquodoboit, tungsten has been found in the form of scheelite. The leads have been worked and are most promising. The value of this discovery is made all the greater by the present unlimited demand for this metal. The hardening of steel, the manufacture of chemical compounds and the preparation of the filament of an improved incandescent lamp are among the chief industrial purposes that call for its exploitation and have stirred up in different sections of the world an interest in its search.

Boring has been continued for coal oil near Lake Ainslie, and prospecting for tin in Lunenburg County, while the mangasese properties in New Ross in Lunenburg, in Tennecape, Hants and in Cape Breton have all been developed. Indications point to greater activity during 1909 in the mining world, and greatly increased output is looked for before the year expires.

# A VISIT TO THE MINERAL DISTRICTS OF CANADA.

Paper Read Before the Institution of Mining and Metallurgy.

By William Frecheville, Past President, and Hugh F. Marriott, Member of Council.

The Canadian Mining Institute recently organized an excursion to the mineral districts of Canada, from the Atlantic to the Pacific. An invitation was extended to the members of the Institution of Mining and Metallurgy to join the excursion, and the Council was requested to appoint two special delegates as the guests of the Canadian Institute. The Council did us the honor to appoint us as their special representatives, and we therefore had the privilege of taking part in the excursion in accordance with the hospitable invitation of our hosts. Thinking that some account of what we saw may be of interest to the members of the Institution, we submit these notes as conveying a very brief and general idea of the trip.

The party assembled in Quebec at the Chateau Frontenac, on August 24th, 1908, where we were received and warmly welcomed by Sir Lomer Gouin, Premier of the Province of Quebec, Sir George Garneau, Mayor of the city, and the Hon. C. R. Devlin, Minister of Mines for the province.

The party consisted of about forty members, and those from England included the Secretary and several members of our Institution, Mr. Walter Johnson, of the Iron and Steel Institute, Mr. John Gerrard, H.M. Inspector of Mines, Manchester, and a number of coal and iron men from the northern counties and Scotland.

Those from Germany included Professor Potonie, of the Berlin University, and Mining Councillor A. Goebel, of Arnsburg, Westphalia; whilst from the United States we had Professor H. Ries, of Cornell University, Ithaca, New York.

The representatives of the Canadian Mining Institute included Dr. Willet G. Miller, President; Mr. H. Mortimer Lamb, Secretary, and Mr. Stevenson Brown, Treasurer; Mr. Eugene Coste, Past President; Mr. R. W. Brock, Acting Director of the Geological Survey of Canada; Mr. James White, Geographer, Department of the Interior, Ottawa, and Mr. J. Obalski, Superintendent of Mines, Province of Quebec; whilst other members of the Canadian Mining Institute, who did not make the whole excursion, joined us at various points. The Hon. C. R. Devlin, Minister of Mines of the Province of Quebec, accompanied us to the asbestos mines, and the Hon. Mr. Cochrane, Minister of Mines of Ontario, went with us to Cobalt and Sudbury.

In the afternoon we were taken for a run on the St. Lawrence in a special steamer, and, among other things of interest, had an opportunity of inspecting the ruins of the railway bridge which collapsed during construction on August 30th, 1907.

In the evening we left by special train for Sydney, Nova Scotia, to see something of the coal mining and iron and steel industries, which are assuming very important proportions in that part of the Dominion.

Our investigations were facilitated by the Secretary of the Institute, who supplied us with copious and lucidly written literature on the country and works we were about to visit; we were also accompanied by prominent men of the district, who gave us all information possible on points of interest. This procedure continued throughout, and added greatly to the interest of the trip.

The literature amassed in the different provinces on the geology, mineralogy and technical details of the districts, was so great that it was not possible to do more than glance at the main points we had to see. At the same time, those who joined the train and accompanied us from place to place occupied our travelling time almost wholly in supplying and, indeed, insisting on giving us all the information at their command. In this way there are very few idle hours to look back upon.

We arrived at Sydney, Nova Scotia, and spent one day in going over works on the property of the Dominion Coal Co. We went by train to Glace Bay, 19 miles from Sydney, and were taken in charge by Mr. G. H. Duggan, General Manager, and by Mr. Charles Fergie, Mine Superintendent. Mr. Fergie was, at the time of our visit, about to relinquish his appointment, and we had the advantage of his company throughout the remainder of the excursion.

The company has an enormous area, some 144 square miles in extent, inclusive of their rights to the three-mile limit. The outcrop of the coal measures fringes the serrated edge of the easternmost section of the Canadian coast line, the general trend of the dip being seaward.

The coal seams total some 37 feet in thickness, divided among six workable seams, the larger varying between 6 feet and 10 feet in thickness. The seams form basins and channels locally, and may be said as a whole to dip to the east at an angle of 10 to 15 degrees; there are no breaks of any consequence in the formation.

The coal is bituminous and very smoky, but has only a low percentage of ash, sometimes as low as 1.75 per cent. The following analysis is from the Emery seam:—

|                       |        |
|-----------------------|--------|
| Volatile matter ..... | 31.10  |
| Ash .....             | 3.65   |
| Fixed carbon .....    | 63.10  |
| Sulphur .....         | 1.51   |
| Moisture .....        | 0.64   |
|                       | <hr/>  |
|                       | 100.00 |

The company works 12 mines, and the output is given as 4,000,000 tons per annum. In the Glace Bay basin the principal bed is known as the Phelan seam. The coal is brought to the surface by means of inclined planes from the outcrop, and by rectangular shafts sunk to strike the seams at depth.

Underground haulage is by means of compressed air locomotive engines of the following capacity: A trip of 1 to 1½ miles is made on each charge; the air is carried in the storage cylinders at a pressure of 950 pounds to the square inch; 40 tons of coal are hauled on each train, giving, say, 60 tons gross per trainload hauled. The upkeep of these engines is said to be inexpensive.

In one of the shafts a very ingenious bottom discharge skip was installed, which was automatically filled and discharged with great speed and regularity. The only attention required was the presence of a man

at the pit bottom to see that the charging hoppers were filled in the right order.

On our return from the coal property and on the way to Sydney we looked at some cement works which were in active operation.

The next day we were conducted through the works of the Dominion Iron and Steel Co., which are situated near the town of Sydney. The company own extensive piers, which receive ore and limestone direct from ocean-going steamers, and from here also is loaded the main portion of the output of steel rails for transport by water inland; 150,000 tons of crude ore and flux are received at the works every month during the shipping season. The iron ore is obtained from the company's own mines in Newfoundland, and is of medium quality.

The output from the works consists chiefly of steel rails and rods. The rails are all taken up for use on the Canadian roads, the industry being protected by a bonus on production. The coal required is derived from the Phelan seam of the adjacent Dominion Coal Co. The mixture supplied to the blast furnaces consists of 2 tons ore,  $1\frac{1}{2}$  tons coke, 1 ton limestone. The resultant metal is taken to the Bessemer converters, where silicon is blown off. It is then treated in the open hearth under producer gas for 9 to 12 hours, and the sulphur and phosphorus are burnt off. The metal is then poured and cast into ingots, after which it is ready for the rolls.

The works appeared to be very well managed, and, from their activity the company should be in a flourishing condition. Certainly nothing was lacking in the equipment which would aid to that end.

On the evening of the 27th of August the Mining Society of Nova Scotia entertained the Canadian Mining Institute and its guests at dinner at Sydney; the President, Mr. C. J. Coll, took the chair, and the Government of the Province was ably represented by Lieutenant-Governor Dr. C. Fraser, Premier G. H. Murray, and Mr. A. C. Ross, M.P.

The following day we visited the coal mines and the blast furnace plant of the Nova Scotia Steel and Coal Co. This company has six collieries in active operation, of which the output last year was estimated at 3,300 tons a day. The four blast furnaces have each a capacity of 200 tons a day, and there are three open-hearth 40-ton steel furnaces.

The output was stated as 15,000 tons of metal a month, of which 200 tons were converted into steel per day. The whole aspect of this company appeared to be that of a successful institution which had gradually increased its operations on its own merits and resources from a small undertaking to its present magnitude.

We returned to Sydney on board a fine ocean going yacht owned by Mr. James Ross, President of the Dominion Coal Co., and were entertained afterwards at a garden party by Mrs. J. K. Ross at her charming water-side residence. We left that night the easternmost point of Canada on the commencement of our long western journey.

Whilst travelling through Nova Scotia and New Brunswick we had our first opportunity of seeing the scenery so characteristic of Eastern Canada; the pine-clad hills sloping down to innumerable lakes, large and small, the abundant evidence of former glacial action in the moraine matter exposed in the railway cuttings, and the smoothly polished rock surfaces were to be observed wherever the soil has been removed.

From Sydney we made our way back to Quebec, where we stayed a day, and left the next morning for the asbestos mines of Thetford, in the special train of the Canadian Pacific Railway Co. which was to take us out to the Pacific and back. This train consisted of three sleeping cars, a dining car and a baggage car, and it is due to the Canadian Pacific Railway Co. to mention that everything connected with our transport was admirably arranged from beginning to end; in fact, we think we may say that all of us have come back much impressed by the excellent organization and management which are apparent in all this company's enterprises; we have travelled in their trains and steamers and stayed in their hotels, and can speak well of them all.

The asbestos mines of Thetford, Province of Quebec, give the impression of being highly prosperous undertakings. The best known on this side in Bell's Asbestos Co., which was formed in 1889, and is said to have been successful from the start, the dividends having ranged as high as  $22\frac{1}{2}$  per cent. in one year on a capital of £200,000. The mill is stated to have a capacity of 250 tons a day.

Adjoining Bell's Asbestos are two other important mines belonging to the Johnson Asbestos Co. and the King Brothers Asbestos Co., both working a continuation of the same deposit as Bell's; their crushing plants are stated to have a capacity of 300 tons and 625 tons per day respectively.

The three principal mines, Bell's, Johnson's, and King Brothers', are grouped about the knob of a little hill, and this small locality is said to produce about 80 per cent. of the total production of Canada, and about 70 per cent. of that of the whole world. The deposit occurs in a mass of serpentine, much squeezed and slicken-sided and intersected by a network of fissures and cracks in which the asbestos has been deposited.

The view held as to its origin is that the serpentine has been dissolved by percolating waters, and deposited in the cracks and fissures in a fibrous form, the chemical composition of the serpentine and the asbestos being identical.

It may be pointed out that several varieties of minerals are included under the term asbestos, the Canadian one being chrysotile, which is pre-eminent not only for its length of fibre, but especially for its exceedingly fine, silky and flexible nature, which renders it particularly applicable for spinning and other processes of manufacture.

The seams in the ground we saw appeared to be, on an average, about  $\frac{1}{2}$  inch wide, with fibre stretching from wall to wall. Numerous seams are smaller than this, and again quite a number wider, up to  $1\frac{1}{2}$  or 2 inches, or even more, but the impression given was that the average would be somewhere about  $\frac{1}{2}$  inch.

To give an idea of the size of the opencast workings, it may be mentioned that at King Brothers' mine it is 700 feet long by about 200 feet wide, with a depth of 165 feet. The rock is blasted out in benches and hoisted to the surface by means of a series of cable derricks working on wire ropes stretched across the working.

At and near the surface the asbestos is, as a rule, considerably changed in character, being yellowish in color and the fibre brittle, and a depth of some feet has to be attained before the fibre assumes its regular color and flexible, silky texture. The impression given was that it would be necessary to go down 10 or 15 feet to get a fair idea of the quality, and, moreover, that the industry entails the handling of such large quantities

of material that tests on a large scale from an extended area would be necessary in the case of a new mine to determine whether it was payable or not.

A valuable report on the asbestos mines and industry was written for the Dominion Department of Mines in Ottawa in 1905 by Mr. Fritz Cirkel, in which an exhaustive description of the industry is given.

In this report it is stated that the percentage of milling rock in the total rock mined varies between 30 and 60 per cent., and that the percentages of fibre extracted from the rock milled varies between 6 and 10 per cent.

We understood, however, that, owing to the increased uses and demand for asbestos, and the perfecting of the methods of extracting the fibre from the rock, poorer material is being treated, so that the lower figure given above is now probably nearer the average, and old dumps formerly thrown away are now being utilized.

The ore raised from the mine is hand-picked, the long fibre being separated by cobbing, and the rest of the material crushed and treated mechanically. A special method of treatment has been worked out of late years, and now the practice at all the mills is on very similar lines. The first crushing is done by jaw crushers; the material is then dried and further reduced by rolls or rotary crushers. It is then treated in what are called fiberizing machines, the function of which is to beat out the little lumps of fibre, so that they assume a woolly texture. After that the material passes over shaking screens, and the fibre is extracted from the upper surface by fan suction. Several grades of fibre are made, the largest being spinning fibre, the next roofing and packing fibre, and the lowest paper stock.

To give an idea of the cost of working, some figures are quoted in the report of Mr. F. Cirkel referred to above, which may be reproduced here. The mine chosen as an example is said to have been worked for years on fairly good ground. Quantity of milling material treated per day (day shift only) 80 to 90 tons, being 60 per cent. of the rock mined; production of asbestos of all grades 9.5 per cent. of the rock milled. Working costs, exclusive of management and general charges:—

|                            |         |
|----------------------------|---------|
| Per ton of rock mined..... | \$0 53  |
| Per ton of rock milled—    |         |
| Mining .....               | \$0 83  |
| Milling .....              | 0 80    |
|                            | — 1 63  |
| Per ton of asbestos—       |         |
| Mining .....               | 8 86    |
| Milling .....              | 8 55    |
|                            | — 17 41 |

Mr. Cirkel estimates that if the plant were increased so as to mill 300 tons a day, the costs would be reduced to \$14.50 per ton of asbestos.

In the same report the prices of the different grades of asbestos in 1905 are stated to vary from \$175 to \$200 per ton for the best, down to \$20 to \$25 for lowest quality (paper stock). We understood that a medium quality, with fibre  $\frac{3}{8}$  inch and under, now fetches about \$40 per ton.

From Thetford we proceeded a few miles to Black Lake station and visited a chrome iron mine, where an irregular mass of chrome iron ore occurs in the serpentine. The ore is crushed in a 10-stamp mill and concentrated on Wilfley tables; the concentrates, we are told, averaged 50 per cent. of oxide of chromium.

From Thetford we proceeded to Montreal, where a banquet was given in our honor by the Montreal branch of the Canadian Mining Institute, and the following day we were driven round Mount Royal and afterwards entertained at luncheon by the Montreal Board of Trade at the Hunt Club.

In the evening we left for Niagara Falls. Here, after seeing the natural beauties of the place, we inspected the three great power stations erected on the Canadian side. The Electrical Development Co., which was first visited, is situated above the Falls. It has the right to 125,000 h.p. This company has adopted the vertical transmission system, in which the turbines are located 136 feet below the upper water level. The power is transmitted directly upwards by vertical shafts to the dynamos at the upper ground level. There are five machines, each developing 13,000 h.p. Each machine takes up 1,200 cubic feet of water per minute.

The Ontario Power Co., whose works are situated below the Falls, has the right to 180,000 h.p. This company takes its water from the river above the former mentioned company, and leads it down to its power station by means of a piep 18 feet in diameter, which is divided on entering the works into 6 pipes, each 9 feet in diameter; 180 feet drop in level is thus obtained. Six machines are installed, each developing 12,500 h.p. The electricity is generated at 12,000 volts and stepped up to 60,000 volts for transmission.

From Niagara we returned to Toronto and, after being entertained at luncheon by representatives of the city, we visited the National Exhibition of Agricultural, Mineral, Industrial and other products of Canada. A specially interesting feature in the exhibition was the collection of mineral specimens from various parts of the Dominion.

From Toronto we proceeded to Cobalt, arriving at that camp on the morning of September the 5th. There our party was split up into several divisions which were taken charge of by a well-organized local committee; a number of the principal mines were visited, the short time at our disposal only admitting of a general idea being formed of what was going on. The local committee very kindly presented our institution with a complete set of local rocks and ores.

The geology of the district, as carefully worked out by Dr. Willett G. Miller, the Provincial Geologist, shows that the formation consists of the very ancient Keewatin Series, consisting largely of igneous rocks older even than the Laurentian granites, as they are cut through by them. Unconformably on these Keewatin rocks, basins and pockets of lower Huronian conglomerates occur in the neighborhood of Cobalt. Around, and in some cases interstratified with the Huronian beds, are intrusions (laccolites) of diabase, the contraction of which, on cooling, is supposed to have caused the cracks and fissures which led to the formation of the silver and cobalt bearing veins.

A recent writer on the geology of the district gives it as his opinion that the Huronian conglomerates correspond with the Dwyka conglomerates of South Africa, and that, like in the latter, the boulders show signs of glacial action. The scattered boulders no doubt are there, but subsequent observers, we are told, have so far failed to find evidences of glacial action on them.

The first discovery of silver ore in this district was on the La Rose vein, so called after a blacksmith in the employ of the railway company during the construc-

tion of the line. We saw the original discovery point, close to the town and near a railway cutting, where immediately below the soil, a narrow vein, rich in native silver, is seen cutting through the hard rock, which is smoothly polished by glacial action.

Before going underground we saw a rich outcrop on a cross vein called "No. 3," which was being uncovered by a longitudinal trench. Here, also, on stripping away the soil, the hard polished bed-rock underneath was seen to be cut through by a vein 6 to 8 in. wide, which, on being cleaned by rubbing, was seen in places to be half native silver.

We then went down to the 80 ft. level on the La Rose vein, where a very fine showing of rich ore was seen. The vein is narrow, rarely exceeding 8 in., and the silver is present principally in the native state, associated with cobaltite and niccolite (kupfernickel) and calc spar.

We also visited the 150 ft. level, where the vein showed a great falling off in value. The main shaft has been sunk deeper into the underlying Keewatin rocks, but we understood the vein has so far not been found to be productive in this formation. The ore is washed and hand-picked at the surface, the picked ore and the fines being sold to smelters in Canada and the United States; the rest of the material is put on the dump, pending the erection of a concentration mill.

We visited the surface equipment of the Buffalo Mine. The treatment process consisted of jaw crushers, rolls and jigs. Finer material was concentrated on Deister tables. The original ore, of value 2,000 to 3,000 oz. to the ton, was hand-picked for direct shipment, and the remainder, together with the country rock which was mined to the extent of 2 ft. on each side of the vein, was sent to the mill. This material is worth about 50 oz. silver to the ton. The vein proper, which is found up to 6 in. in width, consists chiefly of smaltite and niccolite, carrying argentite and native silver.

Coniagas Mine, adjacent to Buffalo Mine, was next visited, and the party conducted through the underground workings by Mr. Leonard, General Manager and part owner of the mine. The surface equipment on this mine followed the same principles as those at the Buffalo. Stamps were also being erected for coarse crushing.

The mine consists of two levels, the first at 75 ft. and the second at 150 ft. vertical. The lower level apparently contains more development than the upper. Some of the workings are termed "drives" and some "cross-cuts," but it appeared that the headings were carried on the veins in all directions, wherever pay ore was found. The ore in the second level was stated to be as good as that in the upper part of the mine, the matrix carrying higher values. The veins proper are calcite in a matrix of diabase and conglomerate.

The actual mineral of the veins is about 1 to 4 in. thick, in two or more stringers. The impression given of the mineral occurrence, was that of a gigantic stockwerk. The veins chiefly run S.E. and N.W. and others cross them at all angles. The Keewatin formation comes in under the conglomerates, and, when that makes its appearance, all values are cut out.

In the afternoon of the same day we visited the Lawson Mine, about two miles distant from the town of Cobalt, where work was just commencing. A trench along the outcrop disclosed, when the soil was stripped away, a rich outcrop for a considerable distance.

Near here we also visited the Crown Reserve Mine, where we saw a marvellously rich collection of hand-picked ore in the cobbing shed. We went underground

to the 80 ft. level and saw some very rich breasts of ore and understood that some \$500,000 worth of ore had been taken out of a small working down to this depth. Rich ore had recently been struck in a shaft 190 ft. distant, and interesting calculations were being made as to the probable value of the ground between the two points.

The ores of Cobalt are not only remarkable for the association of silver with cobalt and nickel, but also for their richness in native silver. At one mine we visited we were told the shipments were averaging 2500 oz. of silver per ton, and instances were mentioned of still higher values being sent from various mines. Other cases are quoted where carload lots of 30 tons have averaged 6000 to 7000 oz. and in one case as high as 38,000 oz. per ton. [The authors hardly mean this.]

Seeing the hard unaltered bed-rock cut smooth by glacial action immediately underneath the soil, with the vein running through it showing very few evidences of chemical action, brought out strongly the fact that the usual decomposed surface rock, together with the gossan of the veins, had all been planed off and carried away, and the general freshness, both of the rock and of the vein matter, suggests that the blanket of ice has not long been withdrawn. The fact that the veins generally occur in patches and basins of Huronian rocks, which are underlain at no great depth by the Keewatin series, raises the very important question as to the behaviour of the veins in passing from the Huronian into the Keewatin series.

It is recognized that, in the neighborhood of Cobalt, the veins in the Huronian beds have, so far, become impoverished on approaching the Keewatin, and are unproductive on penetrating these rocks. On the other hand, cases were given of productive veins in the Keewatin formation altogether, notably at Temiskaming. Owing, however, to lack of time, we were not able to look further into this very interesting question.

The output of the mines of Cobalt, for 1907, is estimated by the Bureau of Mines of Ontario to have had a value of \$5,900,000, and, from what we saw both of the reserves of rich ore in the older mines, and of the rich outcrops not yet developed to any great extent, there is but little doubt that the district has a period of great prosperity ahead of it.

We heard a good deal of talk of promising finds being made in new localities, but time did not admit of our going to see them, much as we should have liked to do so.

We spent a Sunday at Cobalt, and were taken a very pleasant steamer excursion to Lake Temagami, where we landed and visited a large outcrop of iron ore, consisting of a banded formation of magnetite and jasper. The ore was stated to average low in iron—only some 30 per cent.—but it was suggested that, some day, such ore might be rendered suitable for smelting by concentration, as the supplies of iron ore do not seem likely to become more plentiful as time goes on. The interesting statement was made that experience with banded iron deposits in the Lake Superior region has shown that the outcrop ore is sometimes higher in silica than the normal ore in depth proves to be.

In our trip on the lake we passed and observed with much interest an old Hudson's Bay Company's post. It appears that the old route into the northern interior used to pass along this lake up to Lake Temiskaming, the shore of which is within about four miles of Cobalt. It was pointed out that this route has been constantly travelled by white men for 200 years, and that it was not until the railway was built, about five years ago, that the

mineral riches of the locality were suspected, showing what possibilities lie in the vast little-known regions of Northern Canada.

After leaving Cobalt we proceeded to where a branch of the main line conveyed us to Moose Mountain. Here the iron mines were the point of interest. The deposit consists of big magnetite masses running through the Keewatin near the granite contact. The deposits also extended as outliers in the granite. One of these had been extensively opened out by quarry work, and was being put into shape for loading into trucks at the adjacent rail head. The outcrop extended some distance into the forest, and the deposit was evidently of considerable

(To be continued.)

## THE REPORT OF THE GERMAN DEVELOPMENT COMPANY, LIMITED.\*

### II.

1908.

#### Report on Mining Claims in the Montreal River Mining Division by Alfred E. Barlow, M.A., D.Sc.—

From the tone of Dr. Barlow's references to the Montreal River district, it is evident that he is deeply impressed with its importance and is most sanguine as to its future. In his report for 1908 he urges the construction of the branch railway line from Charlton, through Elk City, to Gowganda Lake on the east branch of the Montreal River. He notes the improvement that was made in river transportation during last season, but indicates that, in his opinion, there is peremptory need for rail communication.

The rush to the Miller Lake and Gowganda areas began early in July. A gasoline launch carried passengers from Elk Lake to the east end of the Long Portage, a distance of about twelve miles. Here the canoe route to Bloom, Everett, Miller and Gowganda lakes begins. A portage of two miles brings the traveller to Stoney Creek. Portage, Birch and Pike lakes are passed and the outlet of Bloom Lake is reached. The last named lake is one of a chain in which Wigwam, Lost and Calcite lakes are links. From the beginning of the portage to Bloom Lake the whole distance is about fifteen miles.

Further details concerning the summer and winter routes are followed by description of mining locations and work performed. Incidentally, Dr. Barlow commends the action of the Provincial Government in removing the Mining Recorder's office from Latchford to Smyth.

The geology of the Miller and Everett Lake Mining District, Dr. Barlow states, is almost identical with that of the region surrounding Cobalt. East of Miller Lake, Keewatin is largely represented with smaller masses of intruded (newer) diabase.

To the north the newer diabase contains small included areas of Keewatin, made up, as usual, of different varieties of green schists and altered diabases. The Lower Huronian is composed of slate, conglomerate, and quartzite, in ascending order.

All of the ore bodies occur in the form of veins cutting chiefly the quartz diabase; but, also cutting the

magnetite. The mining company was said to have a contract with the railway company for the carriage of up to 500,000 tons of ore a year to Key Harbor, in Georgian Bay, a distance of 81 miles, for 65¢ a ton. The grade of the ore is: Iron, 54 per cent.; silica, 12 per cent.

Leaving Moose Mountain, we looked at a small gold placer outfit on the Vermilion River. The material treated had the appearance of secondary deposition as moraine matter, and covered the surface of the country round the river banks. It consisted of granite and diabase pebbles lying loosely among earth and sand. Some small stuff, roughly panned, showed gold, but no work was going on at the time of our visit.

quartzite, conglomerate and the green schists and diabases of the Keewatin formation.

While there is no indication of systematic arrangement of the fissuring, some of the more important veins have a north and south direction. The veins vary greatly in width and in vertical and horizontal extension. Those from 2 to 6 inches wide are most common and are apt to be richest. The gangue minerals are chiefly calcite and quartz, the former being by far the more abundant. The so-called "aplite" dikes, cutting the diabase, show a fine to moderately coarse-grained feldspathic material varying in color from pale pink to deep flesh red. "These dikes are in reality a 'diabase pegmatite' having the same genetic relationship to diabase that ordinary pegmatite has to granite. Chalcopyrite is perhaps the most usual and abundant of the metallic constituents, but pyrite, hematite, smaltite, and niccolite, with blooms usually accompanying these two last mentioned minerals, are also very common. So far (late in 1908) no vein with visible silver has been found on claims belonging to this company." To the west and southwest, however, rich silver veins were found on other claims, and northwest, on the Long claim, an aplite dike 12 inches wide showed abundant silver.

Dr. Barlow's report concludes with an expression of high hopes in the ultimate discovery of silver in quantity.

1907.

#### Report on Bighorn, Brazeau and Saskatchewan Coal Lands by D. B. Dowling.

In 1907, Mr. D. B. Dowling, whose work in the western coalfields has attracted much attention during the past few years, chose for the German Development Company three locations. These, Mr. Dowling asserts, are the best in Northern Alberta. They are all on the eastern flank of the Rocky Mountains. The lands were purchased from the Dominion Government.

The Brazeau location is within 65 miles of the projected G. T. P. Railway line, through the Yellow Head Pass. It is 115 miles west from the Calgary and Edmonton road and about 80 miles north from the C.P.R. station at Laggan. The property is four miles long and one mile wide.

\*See Editorial in issue of Jan. 1, 1909.

Sixteen miles to the southeast lies the Bighorn area on a branch of the Saskatchewan River. It contains five square miles.

The Saskatchewan location (320 acres) on the south side of the stream is three miles distant from the Bighorn property.

Although in the mountains southward for 100 miles the coal is semi-anthracite, the coal found in these areas is all bituminous and makes good steam coal. Unlike the Canmore coal, it can be coked.

The three fields are situated on one continuous series of rocks, forming a continuous band about 2,000 feet thick from the Saskatchewan northward to near the main part of the Brazeau River. They lie against the tilted limestones that form here the Bighorn Range. The beds dip from 30 to 40 degrees from the horizontal toward the south-west, and they can be traced almost continuously. Although there is, no doubt, coal in this strip at any portion, still the topography of the country limits the field to such areas as can be approached by railway.

The choice of areas was strongly influenced by considerations bearing on transportation. Mr. Dowling chose for purchase in the three localities such areas as would, as far as possible, cover the portions on which the coal could be attacked cheaply from the surface, leaving for outsiders the portions that would entail great expense for operating.

Most of the coal lands produce only a lignite coal varying in grade from very poor quality in Manitoba to a fair domestic fuel near the mountains. These coals are very light when partly burned and their use on railway engines is prohibited as they start forest and prairie fires.

The lowest horizon is the richest and best, and is brought to the surface only in the folded and faulted country close to the Rocky Mountains. These areas are limited. Their coal content is remarkably uniform. As a rule, less coal is to be found toward the east. In a north and south direction the coal content is fairly constant. Thus at Coleman there is a total of 125 feet coal. On the main line C. P. R. the measures have about 100 feet of coal. Half way north to the Saskatchewan there is 115 feet. So that when 70 feet of coal is found at the Brazeau, there should be no loss of coal in the short distance south to the Saskatchewan River.

The conclusions drawn by Dr. Milton L. Hersey, Montreal, from analyses conducted in his laboratories, are included in Mr. Dowling's report.

Dr. Hersey points out that the very low percentage of sulphur found in the samples submitted to him, indicates that the coke obtained from these coals will be particularly suited to the smelting of iron ores. Nova Scotian coals average about 13,500 B. T. U. Some of the best samples from Big Horn River yielded 14,000 B. T. U. Two samples yielded from 10,000 to 11,000 B. T. U. per lb., which proved them to represent saleable fuels. The rest yielded from 12,000 to over 14,000 B. T. U. All coked except one.

Comparing the samples under consideration with many of the western and eastern fuels that had been analyzed in his laboratories, Dr. Hersey states that the average volatile combustible matter in coals from the Canmore district is 16 per cent.; from Nova Scotian coals, about 35 per cent.; from the above mentioned samples, about 25 per cent. Fixed carbon in the Canadian coals averages about 74 per cent.; in Nova

Scotian coals, 55 per cent.; in the samples analyzed, about 63 per cent.

The ash reported ranges from 27.02 per cent. to 4.60 per cent. Most of the samples are well under 10 per cent. The larger seams are all of low ash content. The high figure quoted above is from a sample of a dirty seam.

A rough approximation using 60 feet for maximum thickness gives 56 million tons per square or a total of 224 million tons of excellent steam coal for the four mile Brazeau area.

On the Bighorn River area, on which is a natural water-power, three seams were measured, two of 4 feet each and the lowest 6 feet. The top seam was high in ash, the lower two were fine bituminous coal yielding a firm, strong coke. A rough estimate gives a total of 10 million tons per square mile for the three seams together. This does not take into account other known seams nor seams as yet undiscovered.

The Saskatchewan River location offers, Mr. Dowling asserts, "the best example I can show of a small area commanding the approach to all the adjacent coal seams."

Mr. Dowling's estimate for tonnage, as far as the three districts have been prospected, shows a total of about 279 million tons.

Notes on the demand for the coal, on competing mines, a table of distances from mines to Edmonton, Calgary, and Innisfail, and a few general notes conclude this section of Mr. Dowling's well-constructed and most interesting report. A diagram, in which the coals from the company's lands are compared with other Canadian and United States coals, is appended.

In our next issue we shall summarize Mr. Dowling's description of the Kananaskis coal area, and Mr. James McEvoy's report on the same lands.

## CARBONS (BLACK DIAMONDS) FOR DIAMOND DRILLS.

By Jacques Baszanger.

Carbonado, or black diamond, is one of the hardest substances known, being sometimes harder than the crystallized diamond. It is, however, unsuitable for cutting into gems, because of its opacity, and its being amorphous. Carbonado was first successfully used by the French engineer, Lechat, in the drills for boring holes for blasting in the St. Gothard tunnel. At present, carbonado is largely employed in diamond drilling, in connection with which it is one of the principal items of cost.

Carbonado is obtained in the Province of Bahia, Brazil, in La Chapada and Lavras districts, where it is mined from stream beds and other alluvion. The miners sell their find to agents of exporting firms in the city of Bahia.

Some very large stones have been found, among others, one of 1,100 karats about 25 years ago; also one of 1,700 karats, and in 1895 a gigantic stone of 3,078 karats or 615 grams, which was purchased as well as broken up by me personally into pieces of suitable size for diamond drills, a special machine being devised for the purpose. This stone was purchased for \$32,000 at the present time it would be worth \$261,630. Several stones of 400 to 800 karats have been discovered during the last ten years, and stones of 100 to 200 karats are frequently found.

Previous to 1870, carbonado was practically valueless. From 1870 to 1872 it was employed as an abrasive for cutting and polishing the white gems and thousands of karats were sold at 50 cents per karat, to be crushed into powder for this purpose. A few years later, when carbonado was employed in diamond drilling, it sold at \$2 to \$4 per karat, and then rose gradually to \$10 per karat, at which price it remained until 1895, after which it advanced by leaps and bounds to \$50 per karat. The price fell back to \$25 per karat, but rose again to \$85 per karat, at which figure it now stands; from present indications, a further advance is expected. The situation is due to the decline in the supply of

carbonado during the last ten years, while the demand has increased. When diamond drilling is resumed more extensively on the Rand, it is expected that it will be even more difficult to supply the demand for carbonado.

Bearing upon this subject of diamond consumption in drilling, it is interesting to remark that in putting down the drill hole at Rybnik (Paruschowitz), Upper Silesia, which attained a depth of nearly 7,000 feet, upward of \$25,000 worth of carbon was consumed. The carbon settings for a drill-bit are expensive. Bits as large as 1 foot in diameter, set with \$5,000 to \$8,000 worth of carbon, are frequently employed in Europe.

## REPORT ON THE MINING AND METALLURGICAL INDUSTRIES OF CANADA, 1907-8.

Issued by the Mines Branch, Department of Mines of Canada.

### A REVIEW.

To compile a directory of the mining and metallurgical enterprises of Canada is what the Mines Branch, under the direction of Dr. Eugene Haanel, set out to do early in 1907.

A special staff of investigators was appointed to collect data in the respective provinces, the members of which were assigned thus:

Yukon Territory—D. D. Cairnes.

British Columbia, Alberta, Saskatchewan and Manitoba.—R. R. Hedley.

Ontario.—Fritz Cirkel and J. J. Bell.

Quebec.—J. W. Bell.

Nova Scotia and New Brunswick.—W. F. Jennison

Definite instructions were given that only producing mines, or mines that were about to make shipment, and metallurgical plants in active operation, were to be reported upon. It was further understood that all information was to be secured at first hand by means of personal interviews and visits.

In addition to the material collected by the above-mentioned staff, several members of the Geological Survey, including Director R. W. Brock, contributed descriptions of special sections. Dr. Haanel in his introductory note refers in most appreciative terms to the manner in which Mr. S. Groves, editor of all the Department's publications, arranged, revised and edited the bewildering mass of material submitted to him.

The Report contains 936 pages of text, wherein are described or mentioned practically all the operating metallic and non-metallic mineral mines of the Dominion; and the metallurgical, clay, and building stone industries. Mineral maps of all the provinces, along with 144 half-tones and diagrams embellish the volume.

Historical notices of the more important branches of the industries in each province are given.

The capitalization and personnel of each organization or company is also mentioned. In the index, about 1,500 names of owners or companies are recorded.

Wherever practicable, details of construction, methods, and costs have been included.

### Part I. Yukon Territory.

In this section, an historical sketch is followed by a short discussion of the methods of placer mining including an extract from a paper by Mr. J. B. Tyrrell, and a note on lode mining.

DR. EUGENE HAANEL, Director Mines Branch, Department of Mines, Ottawa.

We note that, in June, 1908, there were 58 dredging leases, comprising 304 miles of submerged beds of rivers in the Yukon Territory. Twelve large dredges (3,000 cubic yards capacity each) were then in commis-

sion and more were added to the list before the season closed. At Whitehorse a considerable number of copper mines were being worked. At Tantalus and at Sourdough, coal, retailing at from \$15 to \$18 per ton, was being produced.

The equipment, properties, and personnel of the dredging, hydraulicking, and other companies are then detailed. In each case the names of members of the directorate, or of owners, the share capitalization, place of registration, and the country under whose laws the company is incorporated, are mentioned.

Half-tones and an excellent mineral map illustrate the text.

#### British Columbia.

This westernmost province receives its full share of attention. About 200 pages are taken up with its various mining activities. Preliminary notes on placer mining, lode mining, coal, coke, recent development and

a bid for a share of the increasing demand for mining machinery.

Southeastern British Columbia has been prominently brought before the public for some years. The notice given in the report to Atlin and other northerly sections will aid in advertising these undeveloped countries.

#### Alberta.

The coal of Alberta, at present its chief mineral resource, occupies most of the space devoted to this province, although both natural gas and gold receive mention. "In some parts of Alberta almost every rancher is the proprietor of a coal mine; which fact renders the task of securing or compiling accurate statistical data . . . a matter of unusual difficulty." So, also, it indicates the tremendous extent of Alberta's coal deposits, which, when the projected trans-continental railways shall have been developed, will undoubtedly

"Clean Up," Hunker Creek, Y.T.

progress, labor conditions, are followed by ample data concerning the companies engaged in mining gold, gold-copper, copper, silver-lead, zinc, and iron. Power development on the Kootenay and Kettle rivers, a full descriptive list of smelters, and an adequate section on operating coal mines, complete this division.

The full information provided as to the nature and extent of corporate enterprises, particularly of such concerns as the Consolidated Mining and Smelting Co., the British Columbia Copper Co., the Granby, etc., and of the mines, large and small, will prove particularly advantageous to eastern manufacturers. British Columbia is not yet a large manufacturing province. Most of the machinery brought into the province is manufactured elsewhere, in Canada, Great Britain, or the United States. The list of possible customers given here will unquestionably encourage manufacturers to make

contribute largely to the coal production of Canada.

The list of operating companies and the facts concerning analyses, etc., are most impressive. The large land holdings of many of the companies promises well for their development.

Concerning natural gas there is a brief note by Mr. Eugene Coste. It is appropriate to mention here that just as this review is being written, news has come that the C.P.R., under the direction of Mr. Coste, has struck an enormous flow of gas at Bow Island.

#### Saskatchewan.

Three coal-mining companies are listed for this province.

#### Ontario.

This section opens with an historical and statistical outline by Mr. H. Mortimer Lamb. Then follow classi-

Automatic Dumping, Gold-Run Creek, Y.T.

Laurentian Gold Mine—100 Miles East of Kenora, Ont.

fied list of operating mining and smelting companies. Included in these is a 9-page description of the Canadian Copper Company's plant. Iron, copper and nickel, gold, silver, zinc, lead, iron pyrites, graphite, mica, talc, corundum, salt, peat, petroleum, oil and natural gas are dealt with.

We note the omission of mention of feldspar mining. This is an oversight that should be rectified. About 140 pages are given to Ontario. The text will require large additions in the next edition of the volume particularly in view of the expansion of mining activities at and about Cobalt.

#### Quebec.

The pages that deal with the asbestos industry are the most valuable of this section. It comprises a brief historical and statistical summary, a short article upon the geology and uses of asbestos, along with the usual list of companies, etc.

#### Nova Scotia.

This province comes next, the order from west to east being broken by placing the chapter on Nova Scotia ahead of that on New Brunswick. The arrangement of subjects in this chapter is slightly heterogeneous. Historical notes on coal mining are succeed-

ed by these subjects: antimony, gold, iron and steel, coal, statistical review. The information concerning gold mining is well selected, displaying costs, methods, wage rates, etc. The Dominion Iron & Steel Company's plant is well described. So also are the other iron and steel plants.

cial stone, limestone, cement, plaster, pottery, ochre, gypsum and such industries, are written up in the same way as are the general mining and metallurgical industries in Part I.

Wherever practicable the capacity and equipment in all cases of the brick and tile plants are specified. The list of these and kindred plants is impressive.

#### General Remarks.

In outlining any company's operations the method followed is roughly thus:

Name.  
Date of Incorporation.  
Details of Capitalization.  
Locality.  
President and Directors.  
Superintendent.  
Place of Registration.  
Head Office.  
Number of men employed.

The space assigned to one enterprise is more or less commensurate with its importance.

Michel Colliery, Michel: Crow's Nest Pass Coal Co., Fernie, B.C.

In the matter setting forth the holdings and equipment of the Dominion Coal Company there is included the text of the agreement signed in 1904 by the Dominion Coal Company and the Provincial Workmen's Association. This, we think, is hardly needed. Indeed, it is obviously out of place.

#### New Brunswick.

The Imperial Coal Company and the Canadian Antimony Company are the only concerns touched upon. The province's coal, manganese, iron, copper and antimony resources are noted briefly. A complete statistical review of Nova Scotia's mineral production concludes Part I.

#### Part II. Structural Materials.

Taken up in order, from west to east, the brick, tile, sand-lime brick, sewer pipe, building stone, artifi-

It must be borne in mind that this is a first attempt. As the work goes through its annual editions, improvements and changes in matter and form will of course be made. Meanwhile, it is not out of place to offer a few criticisms and suggestions.

The first impression that one receives is that the book is of unweildy bulk. As it contains well nigh 1,000 pages and many maps and diagrams, this is to be expected. But the fact that it is difficult to handle suggests dividing it into two volumes. This could be easily done by binding separately Part I. and Part II.

Another suggestion is that the matter of permanent interest, such as the remarks about the geology, etc., of the districts of each province, be thrown together in the front of the volume, and that the lists of companies, etc., which will have to be changed and added to each year, be printed in smaller type and placed at the back of the volume. Some such arrangement as this would reduce the size of the book and would facilitate changes.

One suggestion more and we shall close. For the benefit of readers a satisfactory bibliography should be appended to each chapter.

## ONTARIO BUREAU OF MINES IN 1908.

Written for the Canadian Mining Journal by  
T. W. Gibson.

The Act of the Legislature which created the Bureau of Mines defined its object to be to "aid in promoting the mining industry of the Province." Just how that aid was to be given was left entirely to those responsible for the Bureau's management. It can fairly be said after seventeen years that the Bureau has justified its existence. It has shown its usefulness in many ways and sometimes in signal fashion. Doubtless its principal function is to furnish information—statistical, geological and mineralogical. Such information must be both timely and reliable.

Hitherto the Bureau has acted upon the belief that a post mortem examination, say, of a mineral district, with nicely worked out and critical details, is of less importance than a preview, even if bold or rough in outline, which will be of practical benefit to those actually engaged in exploiting such a field, or in establishing a new industry. The treatment of the Cobalt silver camp illustrates the working of this principle. It was the Bureau that first acquainted the public with the wonderfully rich discoveries of silver at Cobalt; the fact is that some of the original discoverers themselves did not know they had found silver, until Professor Miller, the Provincial Geologist, apprized them of the truth. This was just before the snow fell in the winter of 1903, and early next spring the Bureau's geologists and surveyors were in the field working out the geology and ore relationships, a task which they accomplished in such a way that the classifications and conclusions reached in a season's examination have stood ever since practically unchallenged, and prospectors went into the field in the spring of 1905 with a geological map and report of the greatest practical use to them in their labors.

During 1908 the attention of the Bureau was directed largely to outlining extensions of the silver-bearing field and defining new ones. In the unsurveyed territory south of the Township of Lorraine, now generally called "South Lorraine," the geology, which is largely similar to that of the Cobalt proper, has been worked out in sufficient detail to enable a map of the district to be prepared, which with a brief report on the field will be published next spring. The Montreal River district, especially the Miller and Everett lakes region, and the Gowganda country, has been treated in similar fashion, and will likewise be the subject of a geological map and report. Mr. A. G. Burrows has had charge of this work, assisted by Mr. R. B. Stewart.

The Gillies limit, which two or three years ago loomed up large in the excited atmosphere then prevailing, has also been subjected under the direction of Mr. James Bartlett to close examination, not confined to the portion known to carry silver-bearing veins, but extending over a great part of the hundred square miles of which the limit is composed.

But silver is not the only metal that the pre-Cambrian rocks of Northern Ontario contain. Iron is even more important than silver, and for several years Dr. A. P. Coleman and Mr. E. S. Moore have been investigating the extensive iron ranges which run easterly from the east shore of Lake Nepigon. On these banded ranges not many bodies of workable ore have yet been found, but there is ground for hope that closer and deeper probing by means of the diamond drill may show that as in the United States Lake Superior fields the

banded ore on the surface is occasionally underlaid by higher grade material at depth.

The iron and steel industry is of prime importance to the country, and was dealt with at length in the Bureau's Seventeenth Report, in which Mr. George C. Mackenzie not only described the condition of the industry in the province, but made a valuable contribution to the information bearing on the concentration of low-grade ores by magnetic processes. Mr. Mackenzie is continuing during the present winter his experimental work on the sulphurous and silicious ores of Eastern and Northern Ontario with a view to determining the best methods of fitting them for utilization in the blast furnace.

It must not be supposed that Northern Ontario contains all the minerals of value in the Province. The fact is that the stratified limestones of the southwestern peninsula carry much wealth in the form of petroleum, natural gas and salt, to say nothing of stone for construction purposes and lime, or of the deposits of brick clay and cement marl which overlie them. The petroleum fields of Tilbury East and Romney, described by the Bureau in a recent report, have given a new lease of life to the oil production of Ontario, and the gas strikes of Haldimand and Kent Counties have brought the advantages of this ideal fuel within the reach of hundreds of thousands of people in this most thickly settled and oldest portion of the province. One result of the work of Mr. G. R. Mickle, mine assessor, has been to put a stop to the criminal waste of natural gas which was going on in these gas fields. However, large a supply of natural gas there may be in any locality, it is strictly limited in quantity, and when it is gone there is an end of it. Anything that will tend to prolong the supply is a public benefit.

In addition to exploring and making known mineral resources of the province, the Bureau of Mines is charged with the duty of enforcing the regulations provided by the Legislature for the protection of workmen in operating mines. There has recently been a serious epidemic of accidents in the mines of Cobalt. The chief classes of accidents have been due to explosions and to falling of men from buckets. When analyzed, it is found that the number of openings and the large quantity of shaft sinking that is done have a direct bearing upon the frequency of these accidents. Explosives of the gelignite class seem to be proving themselves dangerous in the severe weather in winter. Hoisting men in buckets is forbidden by the law, but miners dodge the ladderways and persist in taking the easier but more dangerous route to the surface, via the bucket. Frequent warnings proving unsuccessful in stopping such practices, prosecution of offenders has been begun. It is sincerely to be hoped that mine owners and miners will combine to eliminate all unnecessary risks from the business of mining, which at the best is more or less hazardous.

## THE PROGRESS OF THE ELECTROMETALLURGY OF IRON AND STEEL.

Written for the Canadian Mining Journal by Dr. A. Stansfield, McGill University.

In reviewing the progress of electrometallurgy during the past year one is struck more by the steady improvement in certain branches than by any very startling inventions. The application of electrically generated heat to the production of iron and steel is one of the

most recent, and is becoming one of the most important branches of electrometallurgy, and it is here that improvement in design and increase in the size of furnaces is most marked.

The most successful application of the method of electrical heating to the metallurgy of iron and steel has been in the production of high grade steel, in the electric furnace, either by melting pure materials as in the manufacture of crucible steel, or by melting and refining steel scrap, pig iron, etc., as in the open hearth process. Two types of electrical furnace have been employed, the Heroult furnace and the induction furnace. The Heroult furnace is provided with two vertical carbon electrodes and the heating is mainly affected by electric arcs between these electrodes and the surface of the molten material in the furnace, while in the induction furnace the steel is contained in a ring-shaped trough forming the short-circuited secondary winding of a transformer, and is heated by the electric current which is induced in it. The Heroult furnace resembles the open-hearth furnace in shape and the molten steel which it contains can be readily and completely refined by additions of iron ore, lime, etc., to the slag floating on its surface. The induction furnace with its narrow trough does not lend itself so readily to the refining process, and its use has been restricted mainly to melting pure materials as in the production of crucible steel.

The Kjellin, Colby and other of the original types of induction furnace consisted of a rectangular iron core with a primary winding connected to the electrical supply, and a secondary, which consisted of a circular trough containing the metal to be melted. The primary and secondary were sometimes on the same limb of the core, and at other times on opposite limbs. A combination of these arrangements consists in placing a primary and a secondary on both of the vertical limbs of the core, the secondaries meeting in the middle of the furnace, thus forming a figure 8. The Roechling Rodenhauser furnace is developed from this by enlarging the central part of the channel, and by providing an auxiliary supply of heat for this part of the furnace, which would be insufficiently heated by the current flowing through the narrow secondary circuits. The auxiliary supply of heat is obtained by means of metal electrodes, which are connected to secondary windings of one or two turns on each of the vertical limbs of the core. These electrodes do not enter the molten metal in the furnace, but are separated from it by a thickness of magnesite bricks which form the lining of the furnace. These bricks are non-conductors of electricity when cold, but at the temperature of the steel furnace they conduct sufficiently well to convey the auxiliary heating current from the electrodes to the molten metal. This construction provides a central space in which the refining of the molten steel can be effected, and it also increases the capacity of the furnace without the serious lowering of power factor that attends an increase in size in the simple form of induction furnace.

The furnace described above is operated by single phase current, but by using a core having three limbs, three phase current can be used and the furnace is then more readily adapted to the ordinary conditions of electrical supply. The three-phase furnace has the incidental advantage of producing a circulation of the molten steel, thus insuring a uniform composition.

These furnaces are largely used for finishing steel that has been made in the Bessemer converter or open-hearth furnace. Such steel has had the greater part of the impurities removed and the duty of the electric furnace is to eliminate the final traces of phosphorus and

sulphur, to remove the whole of the dissolved oxide of iron and, finally, to adjust the composition to that required in the finished steel. For work of this class induction furnaces of about 1,000 h.p. require a power of about 90 k.w. per ton of capacity and consume about 150 to 200 k.w. hours per ton of output.

Compared with the open-hearth furnace, the electric steel furnace has the great advantage of being able to remove completely the oxide of iron and dissolved gases, thus getting a sound steel. The phosphorus can be eliminated very perfectly by repeated washing with fresh basic slags, which are then removed, thus enabling the steel to be deoxidized in the furnace without throwing back the phosphorus into the steel. In the basic open-hearth furnace great difficulty is experienced in removing sulphur at all completely because its removal in the presence of iron oxide is scarcely possible. In the electric furnace the phosphorus is first removed, the steel is then deoxidized and the sulphur eliminated as calcium sulphide by reactions similar to those employed in the blast-furnace. The Roechling-Rodenhauer induction furnace are used at the Roechling works in Voelklingen, Germany, and more than 1,000 tons of steel rails had been made in their three-phase furnaces and sold to the German Government before last August.

The Heroult steel furnace is in use in a number of steel plants, mainly for finishing steel that has been made in the basic open-hearth or other steel furnace. They are usually made with a capacity of from 1 to 5 tons. The Girod furnace resembles the Heroult furnace, but it has in addition to the carbon electrodes a number of iron electrodes embedded in the hearth of the furnace. The carbon electrodes in this furnace form one pole, while the iron electrodes form the other pole of the furnace.

A furnace devised by Professor B. Igëwsky, of Kieff, Russia, depends entirely, as the Roechling-Rodenhauer furnace does in part, on the conductivity of heated bricks. The furnace is a rotating drum of firebrick, having thin iron plates laid between the courses of bricks and connected to the sections of a commutator in such a way that an electric current is caused to flow part way around the drum. In this manner the drum and the contained steel or iron is heated and melted. This furnace is only in the experimental stage.

The Lash process for making steel in the open-hearth or electric furnace is intermediary in its action between the ordinary open-hearth process in which pig iron is refined by the action of iron ore from which a certain amount of iron is incidentally reduced by the action of the metalloids in the pig iron, and the electric process for the smelting of iron ores in which carbon is the reducing agent. In the Lash process, iron ore, carbon and shotted pig iron are heated together in some form of furnace such as the Heroult Steel furnace, yielding ultimately steel of good quality. The process will require less electrical energy than the direct reduction process in proportion as more pig iron is used in the charge, but no doubt the pig iron has a physical as well as a chemical use in facilitating the heating and reduction of the ore mixture. In a recent paper by Mr. F. A. J. Fitzgerald it is stated that 50 tons of steel have been made by the Lash process in a Heroult electric furnace at Niagara, 60 per cent. of the charge being iron ore, 23 per cent. cast iron (in the form of borings or shotted pig iron) and the balance being fluxes and carbon. The energy consumption was about one-quarter h.p. year per ton of steel.

With regard to the processes for the direct reduction of iron from the ore in an electric furnace yielding pig

iron or steel, there appears to be nothing to report. Last April a new experimental furnace at Heroult-on-the-Pitt was reported as having been running continuously for several days, turning out over a ton of pig iron per day, but an absence of further reports may be taken to indicate that difficulties have been encountered and have not yet been overcome. The Stassano steel furnace, originally intended for the production of steel direct from the ore is now used for making steel from pig and scrap; a furnace of 1,000 h.p. consuming some 1,000 h.p. hours per ton of steel made from the cold charge.

### BOOK REVIEWS.

**The Commercial Handbook of Canada, 1909, Fifth Year; Heaton's Annual.** Edited by Ernest Heaton, B.A., (Oxon.) Barrister-at-Law, and J. Beverley Robinson. Price, \$1.00. Published in December by Heaton's Agency, 28 Wellington St. East, Toronto.

The Commercial Handbook is designed to present concisely all information that any man of affairs needs in the course of his daily routine. As a directory it contains the names of all Government officials, members of legislatures, postal information, transportation, banking, legal, and other directories, along with customs regulations, etc.

The second part is a digest of the latest official reports of all the industrial activities. A few pages are given to a list of operating mining companies, etc. The "Boards of Trade Register," revised to date, contains a succinct description of every noteworthy town in Canada. In many cases the opportunities offering for manufacturers and investors are noted.

A number of exchange and miscellaneous tables are appended.

A most useful cipher code appears on pages 60 and 61.

Heaton's Commercial Handbook should be of immense value to all mine managers.

**Quarterly Bulletin of the Canadian Mining Institute. Souvenir Number. Summer Excursion.** Edited by the Secretary.

Well nigh 300 pages of narrative, not to mention another hundred pages of miscellaneous matter, including a bibliography of Geological Survey publications relating to the mining districts visited during last summer's excursion, this is the material that goes to make up the latest bulletin of the Institute.

The story of the journey through Canada from coast to coast is attractively told. The Secretary displays a sense of proportion and not a little literary discrimination. At no point does one become weary in reading of the doings of that noble band of excursionists.

At judicious intervals the reader's interest is sharpened by humorous incidents. It is worthy of remark that, staid and respectable as are the members of the Canadian Mining Institute and their guests, there is a noticeable brightening of the atmosphere during the western itinerary. The misogynist might attribute this to the absence of ladies on this part of the journey; but we have no wish to do more than state the fact.

The tragedy that was enacted at Calgary is touched upon deftly. There is, however, a notable hiatus in the Secretary's official account of this soul-stirring event. He omits mention of his own tactical response to the steer's hostile demonstration. This oversight is partly redeemed by a carefully compiled table of casualties.

One of the happiest occasions that marked the peregrinations of the pilgrims was the dinner organized by the effervescent Treasurer on the last night of the journey. If for no other reason, this dinner will be remembered for all time as having brought from Mr. Obalski a weighty pronouncement on the melon industry of Quebec; and a similarly important utterance from Mr. Davies-Evans on the possibilities of gem propagation in Ontario.

Of what happened at Nelson, at Granby, at Glace Bay, we shall leave the reader to learn for himself.

Mr. Lamb has done his work well.

### EXCHANGES.

**Mining and Scientific Press, Jan. 16, 1909.** A discussion held by the Pacific Coast division of the Mining & Metallurgical Society on Nov. 21st, 1908, is reported in this number of our contemporary. The subject of debate was the protection of investors. Many good points were brought out. For instance, one speaker told of the objections that certain directors had to publishing the working costs. It was feared that if the miners knew how cheaply the ore was mined they would assume that the company could pay them more wages.

Another speaker claimed that since a mining engineer is obliged to render to his directors an estimate of ore reserves and cost-sheets, so, in turn, should the directors render to all stockholders a similar report.

**The Mining World, Jan. 23rd, 1909.** An editorial on the "Prospector and the Blowpipe," in this issue of our contemporary, is well worthy of quotation. "In some things," says the Mining World, "a little knowledge may be dangerous, but in others it may mean a fortune. The prospector need not have a scientific or technical education to be fairly successful, but he will find it to his advantage to have a working knowledge at least of chemical analysis by means of the blowpipe as by its aid he will often be able, after a few minutes' work, to determine whether or not a mineral contains anything of especial value. . . . The procedure is simple and easily acquired after a little study and practice. . . . Blowpipe tests do not replace the chemical analysis or assay, but is rather preliminary to it."

### PERSONAL AND GENERAL.

Mr. J. B. Woodworth has returned from a trip to Miller Lake.

Mr. Herbert Salinger, who represents Beer, Sondheimer & Co., was in Toronto on Jan. 22nd.

Mr. Guernsey is spending some weeks in Cobalt in the interests of the Consolidated Mining & Smelting Company.

Mr. George E. Leighton, representative of the Hardy Patent Pick Company, was in Toronto on Jan. 22nd and 23rd. Mr. Leighton has just completed a tour through the coal mines of Nova Scotia and the mines of Cobalt.

The death is announced of Alexander Macdonald (Big Aleck), who became famous some years ago on account of his acquisition of wealth in the Klondike. Mr. Macdonald was a native of Antigonish County, Nova Scotia. A short time ago he lost his entire fortune, but by dint of hard and plucky work he had become a wealthy man.

## INDUSTRIAL PAGE.

### DALLETT COMPRESSORS.

A complete line of air compressors as built by the Thos. N. Dallett Co., of Philadelphia, Pa., bring out many excellent and unique ideas in compressor design.

These compressors incorporate the essential features of having all parts requiring adjustment or renewals, readily accessible, utilizing only the best material and workmanship throughout. A liberal amount of metal, scientifically placed, is used to insure rigidity in operation.

The frame is of the open-work centre-crank type, graceful and pleasing in outline, and of an especially massive and rigid design to obtain on each size compressor a greater range of capacity by substituting, when desired, a cylinder of the next larger size than the standard to operate at 100-lb. pressure. For example, on an 8-inch stroke compressor the regular cylinder for 100-lb. pressure is 8 inches in diameter; but a 10-inch diameter cylinder can be substituted and still operate at the above pressure, whereby a greater volume of air

a rough temporary foundation of timbers, or a permanent one of concrete or brick. An oil gutter is provided entirely around the lower base flange on all sub-bases. This is an excellent feature, as it insures a clean foundation and floor free from unsightly oil puddles and stains.

The steam cylinder and valve gear of the steam driven machines are examples of up-to-date steam engine practice, and are suited to the operation of compressors, giving high efficiency with slight attention. All steam ports are short and direct and of the proper area. The clearance has been reduced to a minimum, giving appreciable saving in steam consumption. A plain D balanced slide valve is used on the small and medium sized machines; the Meyer balanced adjustable cut-off valve being employed on the larger machines. To provide efficient heat insulation, all steam cylinders are lagged with a mineral wool and neatly jacketed with planished sheet steel.

The rocker arms on all valve gears are provided

Sectional Elevation of Single Steam Machine.

is obtained with but a slight increase in cost of machine.

The cross head guides are cylindrical and are bored at the same setting as the boring and facing of the end which receives the cylinder. This insures absolute alignment, as the end is flanged for bolting the cylinder to the frame. The convenience in tightening the cylinder stud nuts, which are on the outside, will be appreciated by the user.

The main bearings are lined with a high-grade bab-bitt metal, which is poured into dovetailed recesses and is thoroughly pinned in to obviate shrinkage, and then bored and scraped to fit the crank shaft.

Lubrication is effected by means of high-grade sight feed devices, or by gravity or force feed system, as desired, and drains are provided for draining off all drippings from guides, stuffing boxes, and crank pit.

Th duplex belt, duplex steam and single steam machines are supported on an exceptionally rigid and deep sub-base, thus making the entire machine self-contained and obviating any possibility of getting out of line, and insuring satisfactory operation on either

with means for adjustment, doing away with all lost motion.

On every steam-driven machine the governor is equipped with a safety stop device, which immediately stops the machine in case the governor belt should break.

In the case of duplex compressors with compound steam cylinders, a difficulty has been that if the machine stops with the high pressure side on dead centre, which occurs frequently, it will not start automatically, this being due to the fact that but one side (the high pressure) takes steam from the line. This trouble has been overcome by using a reducing valve of standard make, which reduces the live steam pressure for use in the low-pressure cylinder. Thus if the high-pressure side stops on the dead centre, live steam is fed to the low-pressure cylinder through the reducing valve, starting the compressor. It is obvious that steam from the boiler is taken into the low-pressure side only when starting, otherwise the operation is identical with any compound machine.

The air and steam cylinders are tied together and

held in position by means of an internally flanged tie or distance piece. On the smaller sizes this piece supports the air cylinder, but on the larger sizes the air cylinder is supported on a pedestal, while the tie piece is of circular design without foot piece. Ample openings are provided on each side of the tie piece to allow

Air Discharge Valves.

adjustment of the stuffing boxes and tightening the cylinder stud bolts.

The air cylinders are of a special hard, close-grained iron and allowance is made for rebor-ing if necessary. Suitable means are provided to obviate any chance of the air valves being drawn into the cylinder in case of breakage. Each cylinder is thoroughly tested before assembling under hydraulic pressure of 200 pounds, and all defective castings are eliminated. The clearance space is reduced to a minimum, and all heads and cylinder walls are thoroughly water jacketed, thus obtaining the highest efficiency possible. Means are provided for draining the cylinder and cylinder head jackets of water, this being essential in cold weather. The lubricant is fed directly into the intake passage, allowing the suction to carry the oil into the cylinder in the form of a fine spray. This mode of lubrication has been thoroughly tried out and found to give efficient and equal lubrication of all working parts.

Mechanically operated inlet valves are supplied on any size compressor if desired. Any of the "Dallett" standard low-pressure compressors are suitable for vacuum service, and are furnished with mechanically-operated inlet valves for a high vacuum.

The piston rod on both belt and steam machines is designed to allow for returning in case of wear. In returning a rod, allowance has been made in size to leave the threads untouched, only necessitating the turning of the straight diameter of the rod.

The cross head is a new type box pattern, made of semi-steel. Its shoes are adjustable and of large bearing surface. The upper shoe is lubricated by means of a sight feed lubricator, and the lower shoe runs continually in a bath of oil. One of the features of this

design is the side openings, which allow easy access to the cross head shoe binder bolts. The cross head pin is tool steel, hardened and ground. It is fitted to tapered seats in the cross head, drawn tight on the tapers by means of a nut held in position by a pin. Means are provided for turning one-quarter revolution in case it wears flat on the two bearing sides, thus doubling the wearing capacity.

The intake valve is of the automatic poppet type, contained in a malleable iron cage. The cage is one piece and combines both seat for the valve and guide for the valve stem. The cage is threaded and screws into the wall of the air intake chamber only and is simply seated in a recess on the main cylinder wall, using thin corrugated copper gaskets to secure a tight point. A hexagonal recess has been cast in all cages to accommodate a special cast steel wrench for use in removing and replacing valve cages.

The valve cage cap acts as a lock nut for holding the cage in place after it has been screwed down on its seat in the cylinder. In the case of a compound machine, corrugated copper gaskets are placed under the valve cage caps on the high-pressure cylinder to insure against any leakage, as the discharge pressure from the low-pressure cylinder is constantly at these joints.

The valve proper is a special alloy hardened steel, with seat and stem ground to gauge. The valve spring is of phosphor bronze and of the right proportion to give the valve an easy opening and a quick closure.

Much annoyance and trouble has been caused on certain makes of intake valves due to the spring holders shearing off or working loose. The cause of this trouble is the sudden stopping of the valve on its seat, which tends to drive the spring holder off the valve

Air Inlet Valve.

stem. This effect may be likened to driving a hammer on its handle by means of hitting the handle on its opposite end. The principle involved is identical.

To eliminate this defect and the trouble caused by threading and pinning the spring holder to the valve stem, solid ends have been employed by some builders,

which necessitates a split guide and complicates the valve parts.

On the "Dallett" valve the spring holder comprises a split taper ring set in a recess on the valve stem, and held together and tight to the stem by means of a solid taper ring slipping down over it. The hammering of the valve on its seat tends to tighten the spring holder on the stem instead of driving it off, due to the action of the taper.

The discharge valve is of the automatic poppet type contained in a valve cage of malleable iron. The method of seating in the cylinder and locking to its seat is identical with that of the intake valve. A projection or boss has been provided on the valve cap which acts as a positive stop for the valve when it has reached a lift giving full opening area, and does away with fluttering. This same projection on the cap also acts as a spring guide for the valve spring.

The discharge valve, light and of ample area, is of the same material as the inlet, having all wearing surfaces ground to gauge.

Both inlet and discharge valves are simple and compact, and each valve requires not over a minute's time for removal complete.

The connecting rod is of the marine type and is to be depended upon for the most severe duty. It is made of the best crucible steel, and both crank pin and cross head boxes are made of the highest quality phosphor bronze bearing metal. Adjustment is obtained at the cross head end by means of a wedge and split box. The crank pin end is adjusted by means of removable tin liners, and both bearing surfaces are of extremely liberal proportion, lubricated by wick wipers.

The crank shaft on both single and duplex machines is exceptionally massive, forged out of a solid billet of mild open-hearth steel, carefully turned and polished. In the case of a duplex shaft, the portion in the centre is enlarged to accommodate the heavy fly wheel.

Cross Head.

The wheels on all machines are heavy and of large diameter, insuring smooth operation and in the case of belt machines, the face is very wide. The fly wheels on the larger machines have square-cored holes in the rim to facilitate turning over by hand.

The inter-cooler plays a very important part in economical operation of a two-stage machine. The "Dallett" inter-cooler is of large cooling area, employing the return flow type of water circulation, using baffle plates to deflect the flow of air and aid in its effectual contact with the cooling tubes. This method is efficient in reducing the temperature of air between stages to approximately the original temperature, thus tending to reduce the final or discharge temperature

and also the horsepower required for a given capacity. The nest of cooling tubes may be removed intact from the inter-cooler box without disturbing any of the piping, as unions are supplied to obviate this feature. The inter-cooler is supplied with pop safety valve, pressure gauge and drain valve.

In a compressed air plant the demand for air is often of such an intermittent character that automatic regulation of the supply of air in accordance with the demand becomes a necessity.

The belt-driven machines are provided with an unloading device which automatically unloads the air cylinder. When a certain determined pressure is reached in the air receiver, one or more inlet valves at both ends

Single Belt Driven Compressor.

of the air cylinder are held open and the load is taken off the compressor, allowing it to run light until the pressure drops in the receiver, upon which the valves are released and air compression is resumed.

On the steam machines, a combined speed and pressure governor is used. This governor unloads the air cylinder exactly the same as on a belt-driven machine, and at the same time it controls the speed, allowing a single steam machine to just turn over, when unloaded, and bringing a duplex or compound machine to a dead stop. By this means a great saving in steam is effected and the wear and tear on the working parts is reduced.

A complete unloading equipment is furnished with each machine.

The compressors described are built in sizes from 8-inch stroke up to and including 16-inch stroke, and give a range of capacity from 79 cu. ft. of free air per minute to 1,200 cu. ft.

Special machines for any capacity, pressure or service, or any standard machine direct connected to motor, water wheel, or gas engine, can be furnished in addition to the standard line.

Sullivan rock drills, air compressors and hammer drills are now carried in stock at Spokane, Washington, by the United Iron Works, who have succeeded the Bradley Engineering & Machinery Company, as agents for the Sullivan Machinery Company. The United Iron Works also represents the Sullivan Machinery Company at Seattle, and will carry a stock of drills, compressors and supplies at that point, 109 Main St. Mr. Austin Y. Hoy, is the personal representative of the Sullivan Company in this territory with headquarters at Spokane.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

**Glace Bay.—U. M. W. of America and the Coal Companies.**—After organizing a "local" of the United Mine Workers of America in Springhill, the paid organizer of this organization has visited Cape Breton, and during the past few weeks there has been great activity in the miners' lodges. One or two of the P. W. A. lodges have gone over bodily to the newcomer. Other lodges are stated by the U. M. W. of America leaders to be dissolved, while the P. W. A. supporters say they are not dissolved, but are still in vigorous existence. One of the most important of the lodges, that at Caledonia Colliery, was declared by supporters of the American body to be dissolved, the charter was ordered to be returned to the Grand Officers of the P. W. A., and steps were taken to realize on the property owned by the lodge. The minority of P. W. A. supporters reorganized themselves, and through the Grand Council of the P. W. A. have applied for an injunction restraining the U. M. W. of America from dividing the property of the lodge among the members. The injunction was granted, and will in all probability be continued until the action of the U. M. W. of America against the P. W. A. is tried, which will, it is expected, take place at Sydney in April. On the result of the main action the continuance or otherwise of the several injunctions and cross-injunctions granted by the courts will of course depend.

Some incertitude has existed as to the attitude which would be adopted by the operators towards the new order, but the coal companies have now declared themselves, and state that they will not recognize the U. M. W. of America as representing their workmen. The Glace Bay Gazette published an interview with the general manager of the Dominion Coal Company on the 20th of January, in which the Coal Company have made public their attitude towards the present agitation, and their views on the general situation thereby brought about. Briefly, the statement of the Coal Company is that they will not recognize the U. M. W. of America; that to do so was impossible because the company had an agreement with the P. W. A. as representing all their workmen, and must keep faith with that organization, as it had been their experience that the P. W. A. was loyal to its undertakings. In the course of this interview the general manager of the Coal Company made the following serious statement: "I am of the opinion that the whole campaign is a direct attack on the Canadian coal trade, which has always been regarded with jealous eyes by the United States operators, and it is the duty of every patriotic Canadian to use his best endeavor to preserve to the people of Canada that which justly belongs to them."

The Nova Scotia Steel and Coal Company have taken the same stand, and it is understood the mainland operators have adopted the same attitude.

The startling increase in the imports of United States coal into the Montreal market, the recrudescence of the agitation against the import coal duty, the persistent competition that is being met with from United States sources, taken together with the present activities of the U. M. W. of America at a time when the large railway contracts are being negotiated, is a concatenation of circumstances that bode ill for the Nova Scotian coal industry.

**Eight Hour Day Commission.**—The commission appointed by the Local Government has commenced its tour, and it is expected evidence will be taken at Glace Bay about the 25th of January.

## ONTARIO.

**Cobalt.**—There has been published not a little criticism of official statements made concerning several of the leading Cobalt mines. The Canadian Mining Journal spoke disapprovingly of the manner in which La Rose flotation was put upon

the market. Since that time La Rose affairs have been conducted with sobriety and with a businesslike air. I don't mean to attribute this to anything said by the Journal. It is due rather to the fact that La Rose executive awakened to the fact that publicity is a darned good thing when properly used. All of the larger mines are waking to this idea. Nipissing gives out full statements. Trethewey partly follows suit. Coniagas, a private corporation, does likewise.

All of us will be glad to see other mines follow the example of those mentioned above.

Lately, Crown Reserve has been getting whacked. Mr. Alex. Gray, who has a keen scent and a prolific pen, took kindly exception to Manager Cohen's assertions as to mining costs. A stockholder of Crown Reserve replying to Mr. Gray, states that Mr. Gray's figures are excessive, and that he has overlooked several factors in making his calculations. I do not care to take sides in this controversy. To me the point seems this: It is remarkable that silver can be mined at a cost of between 8¾ cents (Mr. Gray's figure) and 7½ cents (Mr. Cohen's figure). This fact speaks volumes for the mine and for Cobalt generally. So far as the dispute is concerned, both Mr. Gray and Mr. Cohen are perfectly able to take care of themselves.

Speaking of publicity, is it not time that we knew something about the Provincial mine? If it is a success, we should know. If it is a failure, we have a greater claim to know. The Province is spending money there. The money is yours and mine and the other fellow's. There is no disgrace in any event.

Gowganda is on everybody's mind—everybody, that is, who is not making money in Cobalt. Development up to date has shown several exceedingly rich surface showings. Crowds are rushing in. Many are about as much prepared to face the weather as a three-shell man is to preach the gospel. Snowshoe staking is the order of the day. There will be awful slaughter when the inspectors get down to business next spring.

The Elk Lake district is about a year and a half old. The work that has been done there gives one a fair measure of what may be expected at Gowganda one year hence. Of course, there will be better transportation and all that sort of thing. Nevertheless, the whole country will stand a lot of development. At present a few men with claims to sell are doing a whole lot of damage to the district by shouting too much. The whole truth, apart from excitement, is that the country all around Gowganda gives rich surface indications. This is qualified by the general truth that all the veins discovered are not at all extensive. No one but a fool would attempt to prophesy about the depth, and so on. But there is lots of room for good honest work. This cannot begin until next spring. So when you hear marvellous stories of Gowganda don't be tempted to have a look in until the fakirs have finished their winter campaign. It doesn't pay to get excited.

Now, this does not mean "knocking." The country doesn't require either "knocking" or "boosting." What it needs is the truth as nearly as human beings can come to the truth. Since only a little truth is visible under four feet of snow, we'll have to wait until the April sun has done its business.

Mr. Fraleck, of Cobalt Lake Mining Company, is in Toronto.

Capt. J. E. Leckie is also in the metropolis.

There are a good many well-qualified young fellows, college graduates and others, looking around for prospecting work. A good way for an investor to get his money's worth is to send out a reliable man to prospect for him. Then he'll have the satisfaction of getting one or more good claims—or nothing. And there may be many more Gowgandas.

## BRITISH COLUMBIA.

**Phoenix.**—The new year is starting off with steady and heavy shipments from the various mines now working and things look good for the coming twelve months.

Development in the Phoenix Amalgamated group of the Consolidated Co. is showing up a richer body of ore than it was at first expected the strike of some weeks ago would run. The blocking out of shipping ore on the property continues and arrangements are being made to build a tramway and spur in order that the shipping of ore will be facilitated when the company is ready to ship.

There is nothing new in Dominion Copper affairs. Authorities seem inclined to advise stockholders in that company to keep their stock rather than sell at the very low prices now offered by brokers. Mr. P. F. Roosa, liquidator, has returned from New York but has nothing definite to say. It is said that the engineers who went over the property of the Dominion Copper Co. state that it is not worth more than \$400,000, about one-half of the amount of the outstanding bonds, which amount to \$800,000, then there is about \$100,000 of floating debt and 500,000 shares of stock of a par value of \$5 to be looked after. It makes the situation look dark. But the property has a prospective value under working conditions that may be taken into consideration; what this prospective value is would be hard to say. If the men in charge of the reorganization are inclined to be fair to the stockholders it would seem advisable to have them participate in that reorganization, either by an assessment of some advantage over the general public in the way of securing stock in the new concern, turning in their stock in the Dominion Copper Co.

M. K. Rogers is again to be more intimately connected with the Daly Reduction Co., Hedley, than he has been since he resigned active charge of the work.

The tunnel on the Kingston, Hedley, after leaving the dyke entered a good body of ore. Drifting is now in progress along the contact.

Considerable interest is being taken in the coal measures known to exist in the Similkameen and Nicola districts, and much active work is being done on the properties. It is stated that American capitalists are thinking of building a smelter at or near Oreville, Wash. Should such a plant be erected at this point coke from the Similkameen or Nicola mines would be more likely to find a market there than that from any other district, as a neat sum could be saved in freight rates.

The tunnel on the Bell, Wallace mountain has cut a six-inch vein of rich silver-gold ore. Work is being extended on this adit to tap the main ledge.

Anent the copper combine that is being formed in the Eastern United States, it is stated that neither the Granby nor any of the other British Columbia copper producers are directly interested.

Things are forming themselves for a dividend from the British Columbia Copper Co. This concern, since they resumed work in June, 1908, (to the end of November) made a net earning of \$232,609 from their mining and smelting operations. About 5,547,874 lb. copper was made during the six months. When work was resumed early in the year there was an outstanding debt of \$170,000, which has been paid off and there was a sum in the neighborhood of \$25,000 on hand Nov. 30th. It had been suggested that a surplus of \$100,000 be acquired before dividends were paid; even if this policy is carried out a dividend will be forthcoming early in the present year, 1909.

The tunnel on the Woodburn is now in over 350 feet. It is expected the ledge being driven for will be entered before another fifty feet has been driven.

**Rosslund.**—The Rosslund mines continue to make a steady output. The Le Roi is attracting more than usual attention by the good results being obtained in the operations of mine and smelter. The mine manager's report for November, for example, shows that 6,150 tons of ore were shipped that carried 4,178 ozs. gold, 1,900 ozs. silver and 91,000 lbs. copper. In development work \$12,000 was spent. This output in the gross is valued at \$100,000 and after operating expenses are deducted will show a substantial profit.

The Le Roi 2, Ltd., in November, shipped 2,420 tons, from which the smelter receipts were \$28,795.50.

Some good results have been secured from shipments of select ore from the Blue Bird, Nest Egg and Evening Star mines and considerable work on the smaller properties is likely to be done during the coming year.

**Nelson.**—The zinc smelter is a success! This is the verdict after exhaustive tests, and, finally, the treatment of commercial shipments of zinc ore. The plant of the Canada Zinc Co. has been five years in arriving at its present stage and represents an outlay of nearly \$125,000, of which the Provincial Government advanced \$20,000. The smelter is 10 tons per day capacity at present, but now that it has passed the experimental stage the capacity will be increased to 30 tons per day. The ore so far treated has averaged 40 per cent. zinc, 10 per cent. lead, 12 oz. silver, and 1.5 per cent. copper per ton. The copper is saved in the form of matte. A vertical furnace, heated internally by electricity is used at this smelter. The electrical heating does not destroy the metallic gas, which is the result of heating zinc to a certain point, and any lead in the charge falls to the bottom of the furnace and can be collected separately from the spelter. It can be readily seen what the advantages of this arrangement are over that of treating ore in horizontal retorts as practiced in the zinc smelters. Much labor is done away with and there no expense for breakage or first supply of retorts, etc. The smelters in this district, and elsewhere, penalize zinc ores, as the blast consumes the metallic gas into which the zinc changes, leaving an infusible zinc oxide residue, which eventually leads to the clogging of the furnaces. The condition at the Sullivan mines is a good example of this: Zinc in this district is associated with the lead ore from the surface, where it runs in well defined veins, and can be handled with little trouble, but at depth the zinc blends with the other ore and increases in quantity. In the Sullivan mines this condition reached such an acute stage that the smelter was closed down, the furnaces not being able to handle the ore profitably, as it contained such a quantity of zinc.

The solution of the problem of smelting zinc ore or lead ores containing a percentage of zinc is very welcome to the lead-silver miners of this district, as it will mean in the future a greater production of mines that have hitherto been greatly handicapped and money kept in the country, that was formerly paid foreign smelters for the treatment of zinc.

Kaslo is quite a lead-zinc centre and since the announcement of the success of the Nelson zinc smelter quite a change has taken place for the better. It is stated there are several deals of importance on for promising mines in that section.

The Lucky Jim, at one time a silver-lead shipper, but which afterward developed into a silver-zinc mine, has been bonded to men connected with the Standard Oil Co. It was examined last week by E. W. Jessen and W. A. Bradley, of Spokane, for the Eastern capitalists.

**Vancouver.**—It is said that T. J. Smith raised nearly \$200,000 during 1908 and placed the affairs of the Diamond Vale Coal Co. on a sound basis. The mine is shipping about 100 tons per day.

A diamond drilling outfit is being placed to work on the claims of the Swayne Copper Co., Lynn Creek, across the inlet from this city. The president of the company, Dr. Sawyne, says the ore is self-fluxing, carries an average of 6½ per cent. copper and some gold.

## GENERAL MINING NEWS.

## NOVA SCOTIA.

**Glace Bay.**—The Dominion Coal Company has sufficient orders to keep every one of the mines going at half time for the next two months. It is hoped this year's output will reach the four million mark. There are over 6,000 miners on the payroll.

**Port Hood.**—Despite the unfavorable conditions during 1908, the Port Hood-Richmond Railway & Coal Company has given steady employment so far to miners and surface men. All coal has been marketed at paying prices, and prospects for the coming year are very bright.

**Reserve.**—No. 10 section in the east slope is to be reopened. The opening of this section will give employment to about 20 pair of hand cutters, and will relieve to a certain extent the overcrowding in other parts of the mine. No. 10 has started sinking for a new lift to be ready May 1st.

The erection of the new trestle for banking the Emery slack coal is proceeding very slowly on account of weather conditions, and it will be some days before coal can be banked.

## ONTARIO.

**Amherstburg.**—A large deposit of silica has been discovered near here. Analysis shows that it is nearly 96 per cent. pure, and with no trace of oil. The discovery will probably lead to the establishment of a glass factory in this county.

**Gowganda.**—The Canadian Northern Ontario has been accepting freight for Gowganda via Bellwood since January 20th. Passenger service on the sleigh road is expected to start Feb. 1st.

The T. & N. O. is considering the building of a branch line from Elk Lake to Gowganda.

Mining Recorder Torrance is accepting applications for filing subject to prior right, it being impossible to keep maps up to date from day to day. So great is the rush that a fourth assistant has recently been added to the staff.

Much litigation is expected over the withdrawal by the Government of the lakes, nearly every one of which has been applied for.

**Cobalt.**—Reports from Gowganda and Elk Lake say that there is danger of an outbreak of typhoid owing to prevailing conditions.

Many men are going into the country totally unprovided for the extreme cold, and much suffering is expected.

The shaft of the Otisse-Currie is down 47 feet by 11 feet. The vein, which was three inches wide at the surface, has broadened to 13 inches at the present level. The boilerhouse is completed, and the hoist, pump, and boiler installed.

**Cobalt.**—The framework of the O'Brien concentrator is complete. By the early months of spring it will be turning out concentrates. This will mean a particularly large saving in reight.

The Muggley concentrator has shipped 36 tons of concentrates to Perth Amboy, New Jersey.

A 60-minute motor car service is projected between Temami and New Liskeard by the T. & N. O. Railway Commission.

## BRITISH COLUMBIA.

**Nelson.**—A gold ingot weighing 304 ounces and valued at about \$5,000 was produced at the Nugget Mine on Sheep Creek. This is the fourth ingot made since the stamps were installed last November, making a total value of \$20,000 obtained from second-grade ore in two months.

**Ingenika.**—It is reported that bedrock is struck at a distance of 30 feet on the Ingenika R., and at 90 feet on McConnell Creek. The value at bedrock has not so far been ascertained, as the miners are troubled with over-supply of water.

**Grand Forks.**—E. Jacobs, Secretary of the Western Branch of the C. M. I., has sent out notices stating that the meeting called for January 14th at Greenwood has been postponed until January 25th. Trouble at the mines and smelters caused by shortage of power and general freezing up made it impossible for many members to attend on the original date.

**Kaslo.**—Negotiations are under way for the purchase of the True Blue Mine. The force is to be increased, and it is expected that the mine will soon become a regular shipper.

**Kaslo.**—Ore shipments through Kaslo in December were the lowest for several months, being only 881 tons, including silver-lead and zinc. The total shipments for the year amount to 13,691 tons, of which 6,318 tons were silver-lead and 7,373 tons zinc ores. Practically all the zinc tonnage came from the White water Deep Mine.

**Phoenix.**—About 240 men are working regularly at the Mother Lode Mine. In winter all the ore is mined from the interior stopes, and it requires a larger force to keep up the requirements of the smelters.

Practically all mining in the Boundary and West Kootenay was suspended for four days through lack of electrical power, anchor ice interfering with the plants.

**Greenwood.**—The fourth general meeting of the Canadian Mining Institute is to be held here on January 25th. The only nomination for chairman is that of Mr. T. Kiddie, manager of the Northport Smelter. Twelve members of Council of the branch will be elected by ballot. The members of the General Council will be members ex-officio of the Branch Council. The members are to be distributed territorially.

**Vancouver, Jan. 13.**—Vancouver men have acquired coal lands on Slate Chuck Creek, Queen Charlotte Islands, on which operations will start May 1st.

The formation is of sandstone, shale, and schist, and the coal a good anthracite. If the diamond drill proves coal at depth, it is proposed to erect a suitable plant. In order to handle both anthracite and bituminous coal, coke ovens and tram lines to deep water will be built.

Should the Queen Charlotte coal prove good, a line of steamers will be established between Queen Charlotte and Mexico, where the same people are reported to be establishing a large steel plant at a cost of ten million dollars. If the iron ores at Cumshwa Inlet are as represented, the same parties will doubtless establish steel works on Queen Charlotte Island.

**Windy Arm.**—The concentrator at the Venus Mine is now handling 100 tons per day, and preparations are being made to double this capacity.

The Montana Mine is now being developed by the Yukon District Gold Mining Co., which controls most of the mines now being worked.

The outlook has improved lately, on account of some excellent new discoveries. On the East Rand the Brokpan Mines has encountered some extremely rich ore. The New Modderfontein's extensive property has opened up satisfactorily, and the reduction and treatment plants have to be enlarged to deal with the increased output. On the Central Reef the City Deep Co. has exposed a quantity of ore assaying nearly £2 per ton. In the Main Reef West high values over a considerable area have been exposed.

# MINING NEWS OF THE WORLD.

## GREAT BRITAIN.

The Board of Trade returns show total exports of coal during 1908 amounting to 65,180,646 tons, valued at £41,615,923, as compared with 66,063,258 tons, valued at £42,118,994 in 1907. In addition, 19,474,174 tons were shipped for the use of steamers engaged in the foreign trade, as against 18,618,828 tons in 1907. The principal increases were in shipments to the North of Europe, while exports to Germany, Holland and Egypt showed a considerable decrease.

An estimate of the profits of South Wales collieries, based on the operations of twelve leading companies gives the gross profits per ton of output for 1907 as 2s. 5d. For the present year, taking into account the effects of the Eight Hour Act, the estimate of probable profit is 1s. per ton.

## RUSSIA.

There has been a considerable decrease in the gold industry on the Lena and the neighboring gold fields. But at Vitim and Olekma the situation is improving and the output increasing. At the mines of the old companies twice as much gold has been washed as formerly, and modern methods are being largely introduced.

## HUNGARY.

Fifty-six miners lost their lives by an explosion in the Auka coal mine at Veszprim, about 60 miles from Budapest, on the 14th of January.

## AUSTRALASIA.

A French syndicate, which has been operating for three years on an alluvial field known as McCaulay's Lead, 20 miles from Chatsworble, New South Wales, will put in modern gold-saving machinery, costing several thousand pounds, having been able to secure good results by primitive methods.

The Broken Hill Proprietary mine, New South Wales, has closed down, owing to the refusal of the men to accept a reduction of wages. Four thousand men are directly concerned, and a larger number indirectly affected. The question of wages will be referred to the Federal Arbitration Court.

The ore reserves of the North Lyell copper mine, Tasmania, have been increased by 169,121 tons during the six months ending September 30th. There is now available for stoping at the North Lyell 710,333 tons.

The discovery of a new tin-field in the Gunyale district, Victoria, is reported. Tin has been found on the surface, and an area of some 2,000 acres has been staked.

## SOUTH AFRICA.

Greater progress was made in the gold mining industry of the Rand during 1908 than in any previous year. The great

feature has been the general reduction in working expenses, owing to the installation of tube mills and larger batteries with heavier stamps and greater attention in the matter of securing efficiency in labor. Some of the larger mines fitted with up-to-date machinery capable of handling ore in large quantities are profitably crushing ore of as low value as 4½ dwts. to the ton. The chief mechanical appliance which has contributed to these improved conditions is the tube mill, of which some 115 were operating at last accounts, as compared with 72 at the beginning of last year. During November the average working costs of the mines on the Rand amounted to 17s. 6d. per ton, a reduction of 1d. per ton as compared with October.

The coal export trade via Delagoa Bay is assuming respectable dimensions. A shipment of 2,000 tons was recently made to Madras, India, being the first to that destination.

## UNITED STATES.

The Colorado Legislature is considering a bill providing for the creation of a state commission to control the smelting industry, along lines similar to those of the railroad commission. The measure also provides for a state assayer and for the erection of a refining and smelting plant at the State School of Mines at Golden, where smelting in all its branches may be taught.

The Heroult electrical smelting plant in Shasta County, California, operated by the Noble Electric Steel Co., is going ahead with installation, and the power is ready to be turned on when the smelters are finished.

About 150 miners were killed by two successive explosions on December 28th and January 12th at the Lick Branch colliery, near Bluefield, West Virginia. A disastrous gas explosion also took place at Joseph Leiter's colliery at Zeigler, Ill., on January 9th, resulting in the loss of 25 lives.

Diamond mining is being successfully prosecuted in Pike County, Arkansas. The total number of stones so far found is 540, of which 505 weighed 217 carats. The largest so far discovered weighs 6½ carats. Many of them are of good water and remarkable purity.

A merger of gold-dredging companies having interests near Folsom and at Oroville, Cal., has been effected, the cost of purchasing the interests involved being \$7,000,000. The new company is capitalized at \$25,000,000.

## MEXICO.

The Concheno Mines, in Chihuahua, purchased by the Greene Gold-Silver Co. from Corrigan, McKinney & Co., of Cleveland, O., for \$1,250,000, have reverted to the vendors on account of the inability of the purchasers to meet their payments.

Some of the Mexican mining corporations are planting eucalyptus trees on their properties to secure future supplies of mine timber, anticipating that present sources may before long be exhausted.

# COMPANY NOTES.

## NIPISSING ISSUES FINANCIAL STATEMENT.

A brief financial statement of the operating company dated January 1, 1909 shows cash and ore to total \$972,643 against \$977,000 at the end of September. In detail this statement shows:—

|                                        |           |
|----------------------------------------|-----------|
| Cash in bank and bullion on hand ..... | \$495,652 |
| Ore in transit and at smelters .....   | 380,828   |
| Ore sacked ready for shipment .....    | 96,163    |
| Total .....                            | \$972,643 |

The company is carrying less ore sacked and ready for shipment, the item falling below the \$100,000 mark, comparing with \$112,000 six months ago and \$200,000 nine months ago.

## BROME COUNTY ASBESTOS CO.

The annual meeting of the shareholders of the Brome County Asbestos Co., Ltd., was held at the head office of the company in Eastman on the 19th inst., when the same Board of Directors were re-elected, and the following officials were appointed: F

A. Olmstead, President; C. A. Nutting, Vice-President; A. C. Lytle, Secretary-Treasurer.

The net earnings of the British Canadian Asbestos Company for the seven months of the fiscal year ending December 21st amounted in round numbers to \$110,000, so that after deducting bond interest for the entire year, viz., \$50,000, a surplus of approximately \$60,000 was left over, equal to 6 per cent. on the stock.

#### BRITISH COLUMBIA COPPER DIVIDENDS.

The directors of the British Columbia Copper Company intend to resume the payment of dividends early during the coming year. The company declared its initial quarterly dividend of 25 cents per share, and an extra disbursement of 15 cents a share, or a total of 40 cents a share, on July 18th, 1907. The directors are in favor of paying 2 per cent. bi-monthly or 12 per cent. a year. A dividend of 2 per cent. on the preferred shares of this company for the quarter ending December 31st, 1908, has been declared.

#### PONTIAC SILVER MINING CO.

A meeting of the directors of the Pontiac Silver Mining Company was held in Toronto on January 22nd. The following officers were elected: President, Clifford H. Moore, of Cobalt; Vice-President, W. E. F. Paine, of Toronto; Managing Director, Harold P. Davis, of Cobalt.

The capital of this company is \$1,000,000, divided into one million shares of \$1 each, with 300,000 shares in the treasury.

The directors of the company have authorized the sale of 100,000 shares of the treasury stock at 30 cents a share, and a large proportion of this issue has already been taken up by individuals interested in the company.

A small plant will be installed at once. The Flynn property, which consists of 22 2-10 acres, adjoins the Drummond Mine, and was purchased in November by Mr. Harold P. Davis. Since that time a force of men has been at work. Early in December the discovery was made of a rich vein of calcite and silver. After obtaining a satisfactory report from Mr. Frank C. Loring, the Pontiac Silver Mining Company was organized to take over his property.

A shaft has been sunk 25 feet on this vein, some distance from the original discovery, with favorable results.

The vein in the bottom of the shaft is from 10 to 20 inches wide, and carries silver values from the surface, ranging from 0 oz. upwards.

It is the intention of the management to sink this shaft to depth of 100 feet, and drift on the vein at the 50-foot and 00 foot levels. There is every indication that the drift at the 0-foot level will develop a body of high-grade silver ore.

The Board of Directors of the Kerr Lake Mining Company on January 7th declared a quarterly dividend of 4 per cent. upon the capital stock of the company, payable March 15th, 1909, to stockholders on record at close of business March 1st, 1909. Transfer books will be closed from 3 p.m., March 1st, 1909, to 10 m., March 6th, 1909. This is dividend No. 14.

The City of Cobalt Mining Co., Limited, has received permission to increase its capital stock from \$500,000 to \$1,500,000.

Dominion Coal has declared the usual half-yearly dividend of 3½ per cent. on the preferred stock, payable February 1st.

The Ontario Government has received a cheque for \$15,000, being royalty for the last three months of 1908 from the Crown Reserve Mine. The Government receives this on a 10 per cent. basis.

An extra monthly dividend of 1 per cent. has been declared by the directors of the Buffalo Cobalt Mines, Limited. The

dividend is payable on February 1st to shareholders of record January 20th. The books will be closed on January 20th and re-opened on February 2nd. This is the second monthly dividend declared by the Buffalo Mines, the first being paid on January 1st, together with a quarterly dividend of 5 per cent.

#### TRETHEWEY SILVER-COBALT MINE, LIMITED.

##### DIRECTORS' REPORT.

To be Submitted to the Annual Meeting of Shareholders to be Held at Toronto on Wednesday, the 27th day of January, 1909.

The Directors have pleasure in submitting the following Report, Statement of Revenue and Expenditure, and Balance Sheet, covering the period from 31st August, 1907, to 31st December, 1908:—

|                                                                                       |              |
|---------------------------------------------------------------------------------------|--------------|
| The total Revenue from all sources during the above-mentioned period amounted to..... | \$357,970 78 |
| The total Expenditure chargeable against the period was .....                         | 147,446 47   |

|                                                                                             |              |
|---------------------------------------------------------------------------------------------|--------------|
| Showing a surplus of Revenue over Expenditure of.....                                       | \$210,524 31 |
| Out of which sum Dividends have been paid, amounting to 15 per cent. of Issued Capital..... | 141,817 50   |

|                                                                                 |                  |
|---------------------------------------------------------------------------------|------------------|
| Leaving a balance of .....                                                      | \$68,706 81      |
| The balance at credit of Revenue Account on previous balance sheet was.....     | \$48,886 79      |
| Against which are chargeable payments made in present period amounting to ..... | 4,485 35         |
|                                                                                 | <u>44,401 44</u> |

|                                                                                                                                       |              |
|---------------------------------------------------------------------------------------------------------------------------------------|--------------|
| The Balance at credit of Revenue Account at December 31st, 1908, being.....                                                           | \$113,108 25 |
| Additions to buildings and equipment installed during the period amount to \$15,661.46, bringing the total of these accounts to ..... | 50,808 71    |
| Less Depreciation .....                                                                                                               | 5,351 58     |

|                                               |             |
|-----------------------------------------------|-------------|
| Leaving a present estimated valuation of..... | \$45,456 13 |
|-----------------------------------------------|-------------|

Repairs to buildings, equipment and plant, and all replacements, amounting to the sum of \$6,349.85, have been charged to operating expenses.

The liquid assets of the Company as at 31st December, 1908, consisting of cash in hand, due from Smelters, and ore in transit, amount to \$139,309.15. The ore in transit and due from smelters is estimated on the basis of the price of silver on the 31st December, 1908, namely, 50¼c per oz. Each one cent per oz. advance in the price of silver adds approximately \$2,500 to the liquid assets.

The total ascertained liabilities amount to \$11,522.31.

##### Production.

The production and receipts from the sale of ore have been as follows:—

|                                               |              |
|-----------------------------------------------|--------------|
| Gross value of ore of all grades shipped..... | \$398,638 47 |
| Freight and treatment charges .....           | 42,958 14    |

|                                |              |
|--------------------------------|--------------|
| Revenue from sale of ore ..... | \$355,680 33 |
|--------------------------------|--------------|

##### Improvements.

Numerous improvements and additions to property and plant have been made, including a partial concentrating plant hereinafter referred to; machine drill sharpener; condenser; electric generator; triplex pump and motor, driven by a high-speed Robb-Armstrong engine, etc.

The heating plant has been rearranged to utilize waste heat from exhaust steam, and many other minor improvements have been made in various departments.

### Development.

There are now three working shafts, situated near the southerly end of the property. No. 1 and No. 2—approximately 650 ft. apart—are connected by a drift on vein "F" at the first, or 50 ft. level. No. 2 and No. 3 shafts—110 ft. apart—are connected at the second level, which is 140 ft. below the collar of No. 2 shaft. No. 3 shaft has been sunk to a depth of over 200 ft., where a third level is being run east to the Nipissing boundary and west towards and under No. 2 shaft.

The total amount of shaft sinking, upraising, drifting and cross-cutting in these workings is over 4,500 ft.

Several thousand feet of surface work has been done, consisting of trenching, open cutting, and sinking prospecting shafts on veins and fissures occurring towards the northerly end of the property, but owing to the geological conditions there existing these operations failed to disclose any ore bodies of economic value. It has been demonstrated that the veins in that locality, with one exception, namely, the discovery vein on the Temiskaming & Hudson Bay location, do not carry values until considerable depth is reached, which confirms the experience already gained by this Company and referred to in the last Annual Report. By arrangement with the Temiskaming & Hudson Bay Company, a tunnel was run from the workings at their 100 ft. level towards and across the Trethewey north line, where the apex of a rich silver vein was encountered. This is now being developed from the 150 ft. level of the neighboring property, and from present indications should prove to be an important source of additional revenue to this Company. When sufficient development work has been done at the north end it is the intention of the management to sink a working shaft near the centre of the location. This will enable operations to be conducted from a central point and render it feasible to undertake systematic underground exploration of the property, which has as yet been developed within only a comparatively small portion of its area. There are numerous veins of no economic value showing at many places on the surface, some of which it is reasonable to assume may prove to occur under the same conditions as the north vein and be found to carry values at depth.

Diamond drilling operations were discontinued early in last year, after several veins had been located and important geological information gained, which has been turned to account in the conduct of mining operations.

Owing to the impossibility of accurately estimating the amount and value of ore placed technically in sight by development work on veins of the character existing in the camp, no attempt has been made to make such estimate, and the total cost of all exploratory and development work has been and will continue to be charged to operating expenses.

It is the intention of the Directors to continue an aggressive policy of development. Sinking will be resumed in the near future at No. 3 shaft, so as to carry on operations at greater depth on the various veins occurring in that locality. It is also intended to resume drifting from the lower level west from No. 1 shaft. This drift was abandoned in "Keewatin," where silver values had ceased to be found, although the vein remains strong and well-defined. Underlying the Keewatin a boss of diabase outcrops to the west, and the intention is to continue drifting through the Keewatin into the diabase in order to ascertain whether the silver values will re-occur when the vein enters the latter formation. In the event of this proving to be the case, sinking at No. 1 shaft may be resumed with confidence of reaching deeper ore deposits of value at that point.

### Concentrating.

The system of treating ores adopted at the mine is at present confined to crushing and hand sorting, followed by partial concentration in a double compartment Hartz jig, the hutch product from which is treated on a coarse concentrating table. By the above process the grade of ore formerly shipped as screenings, running from 100 to 200 oz. per ton, and carrying about

70 per cent. of country rock is made to produce a high-grade product running from 1,500 to 2,000 oz. per ton, thus saving a heavy expenditure for freight and treatment charges on the bulk of the material formerly shipped. These operations are exceedingly satisfactory, only a very low-grade ore being sent to the dump for future treatment.

The question of erecting a more elaborate concentrating plant has been deferred for many reasons, amongst them being the prospect of the establishment of a local reduction works for the complete treatment of Silver-Cobalt ores. The results obtained from actual practice in the concentrating plants already established in the camp show losses varying from 15 to 25 per cent. of the assay value of the ores dealt with, while the resultant product has to bear the existing high rates of freight and treatment charges before net returns are reached. If treated to a finish at local reduction works at the minimum of cost with a saving of 98 per cent. to 99 per cent. of the assay values, a large tonnage of low-grade ore will be rendered available for profitable treatment, which, more particularly at the present low price of silver, will barely stand the cost of existing methods.

A test run of low-grade ore is being made at the present time through the mill of the Northern Concentrator Company at Cobalt, the results of which will be reported at the Annual Meeting, at which there will also be produced maps and plans showing the position of underground workings as at 31st December, 1908.

ALEX. M. HAY, President.

Toronto, Jan. 16th, 1909.

Shareholders of Temiskaming have received the following circular:—

"Whereas the Pennsylvania-Cobalt Silver Mines, Limited, is a corporation with an authorized capital stock of \$1,000,000, divided into 1,000,000 shares of the par value of \$1.00 each;

"And whereas this company is the holder of 499,997 fully paid shares of the said capital stock, and 300 shares of the said capital stock are also held by the nominees of this company;

"And whereas the directors authorized and directed B. E. Cartwright and Alexander Faskin to negotiate for the purchase of 500,000 fully paid-up shares of Pennsylvania-Cobalt Silver Mines, Limited, at a price not exceeding \$100,000;

"And whereas on the 20th day of October, 1908, the said Cartwright purchased the said 500,000 shares, the price to be paid being 100,000 fully paid shares of the capital stock of this company;

"And whereas the said purchase by the said Cartwright has been confirmed by the directors of the company, and R. A. Cartwright has, at the request of the company, paid to the vendor the 100,000 fully paid shares of the capital stock of this company, being the purchase price of the said stock so purchased

"Now be it enacted as a by-law of this company that upon the said 500,000 fully paid-up shares of the capital stock of Pennsylvania-Cobalt Silver Mines, Limited, being transferred to this company, 100,000 fully paid-up shares of the capital stock of this company be issued and allotted to the said R. A. Cartwright or to his nominees. And further that the said shares so to be allotted shall carry dividends as and from the said 20 day of October, 1908, and that the dividend declare payable on January 1st next, to shareholders of record at the close of business on the 18th day of December, 1908, to be paid to the said R. A. Cartwright on the said 100,000 shares so to be issued to him as aforesaid on the first day of January 1909.

"Passed this 5th day of December, A.D. 1909."

# STATISTICS AND RETURNS.

## CROW'S NEST COAL.

The Crow's Nest Pass Coal output for the week ending January 8th was 7,926 tons, compared with 23,379 tons last year.

The output of the Crow's Nest Pass Coal Company collieries for the week ending January 15th was 12,753 tons, making the daily average 2,125 tons. The general manager adds to his report that weather conditions were most unfavorable all week.

## INTERCOLONIAL COAL MINING CO., LTD.

The output of the Intercolonial Coal Mining Company, Westville, N.S., for 1908, was 305,913 tons, as compared with 307,844 tons in 1907, a loss of 1,931 tons. Disposals for 1908 and 1907 were as follows:—

|                        | 1908.<br>Tons. | 1907.<br>Tons. |
|------------------------|----------------|----------------|
| Water sales .....      | 45,292 00-20   | 65,876 10-20   |
| Rail sales .....       | 191,300 06-20  | 191,866 16-20  |
| Land sales .....       | 7,857 07-20    | 7,423 16-20    |
| Consumption .....      | 28,563 07-20   | 28,368 18-20   |
| Coke ovens .....       | 6,581 00-20    | 14,227 00-20   |
| Brick plant, etc. .... | 935 00-20      | 1,637 00-20    |

A considerable quantity of small coal was placed on bank, due to the fact that there was no market for that grade, the iron works of the province being very dull. The importation of American bituminous coal into the Quebec market in 1908 reached figures which are a decided menace to the coal interests of the Maritime Provinces.

As regards 1909, it is anticipated that the output will be about the same as that of last year, and disposals will likely show up about the same figures.

## THE CONSOLIDATED MINING & SMELTING COMPANY OF CANADA, LIMITED.

Smelter production for twelve months ending December 31, 1908:—

|              | Quantity.       | Gross Value. | Per cent. |
|--------------|-----------------|--------------|-----------|
| Gold .....   | 116,314 oz.     | \$2,384,437  | 47.27     |
| Silver ..... | 2,100,457 oz.   | 1,102,846    | 21.86     |
| Copper ..... | 3,753,139 lbs.  | 506,460      | 10.04     |
| Lead .....   | 35,999,145 lbs. | 1,050,455    | 20.83     |

Total value .....\$5,044,198 100

Tons Smelted.

Lead furnaces ..... 51,022

Copper furnaces ..... 267,384

Total smelted ..... 318,406

## COBALT ORE SHIPMENTS.

Following are the weekly shipments from Cobalt camp, and those from January 1, 1909, to date:—

|                               | Week ending<br>Jan. 9. | Since<br>Jan. 1. |
|-------------------------------|------------------------|------------------|
|                               | Ore in lbs.            | Ore in lbs.      |
| Buffalo .....                 | 44,020                 | 44,020           |
| Coniagas .....                | 35,630                 | 109,690          |
| Cobalt Central .....          | 40,000                 | 40,000           |
| Chambers-Ferland .....        | 80,000                 | 80,000           |
| City of Cobalt .....          | .....                  | 63,090           |
| Kerr Lake .....               | .....                  | 61,000           |

| Temiskaming & Hudson Bay..... | .....                   | 80,000           |
| Muggley Con. ....             | .....                   | 72,000           |

Ore shipments to date for 1909 are 2,292,277 lbs., or 1,146 tons.

Nova Scotia Mine shipped to Denver; La Rose to Denver and Copper Cliff; Crown Reserve to Denver and Copper Cliff; O'Brien to Denver; Trethewey to Carnegie; Nipissing to Balbach; McKinley-Daragh to Denver.

The official list of Cobalt shipments for the year has been compiled as follows by Mr. A. A. Cole, of the T. & N. Railway:

|                                       | Tons.     |
|---------------------------------------|-----------|
| Buffalo .....                         | 536.90    |
| City of Cobalt .....                  | 761.04    |
| Chambers-Ferland .....                | 223.89    |
| Cobalt Lake .....                     | 225.97    |
| Coniagas .....                        | 610.25    |
| Cobalt Central .....                  | 276.79    |
| Crown Reserve .....                   | 657.35    |
| Cobalt Silver Queen .....             | 885.70    |
| Drummond .....                        | 1,161.38  |
| Foster .....                          | 191.20    |
| Kerr Lake .....                       | 660.24    |
| King Edward (Watts) .....             | 338.19    |
| La Rose .....                         | 4,843.17  |
| McKinley-Darragh .....                | 1,808.39  |
| Nipissing .....                       | 3,571.96  |
| Nova Scotia .....                     | 237.95    |
| Nancy Helen .....                     | 201.32    |
| O'Brien .....                         | 3,459.51  |
| Peterson Lake (Little Nipissing)..... | 40.67     |
| Provincial .....                      | 75.84     |
| Right of Way .....                    | 750.04    |
| Silver Bar .....                      | .58       |
| Silver Cliff .....                    | 160.44    |
| Silver Leaf .....                     | 197.03    |
| Temiskaming .....                     | 795.20    |

## BRITISH COLUMBIA ORE SHIPMENTS.

## Week Ending January 9th.

Nelson, Jan. 9.—The extreme cold spell has interfered with the mines in the Boundary, and all the properties have been forced to close down until the weather moderates. The ore shipments for the past week and year to date are as follows:—

| Boundary—         | Tons.  |
|-------------------|--------|
| Granby .....      | 22,782 |
| Snowshoe .....    | 3,586  |
| Mother Lode ..... | 9,828  |
| Oro Denoro .....  | 340    |
| Sally .....       | 21     |

Total ..... 36,557

| Roseland—                   | Tons. |
|-----------------------------|-------|
| Centre Star .....           | 3,186 |
| Le Roi .....                | 959   |
| Le Roi No. 2 .....          | 500   |
| Josie Concentrates .....    | 84    |
| Le Roi No. 2 (milled) ..... | 260   |

Total ..... 4,989

| Slocan Kootenay— | Tons. |
|------------------|-------|
| Total .....      | 3,760 |

Total shipments for week and year to date are 45,306 tons.

The smelter receipts for the week are:—

|                          | Tons.  |
|--------------------------|--------|
| Granby .....             | 22,752 |
| Greenwood .....          | 10,168 |
| Northport (Le Roi) ..... | 1,183  |
| Trail .....              | 8,494  |

Total ..... 42,627

The following are the ore shipments for the week ending January 16th and year to date in tons:—

| Boundary—         | Week. | Year.  |
|-------------------|-------|--------|
| Granby .....      | 7,871 | 30,653 |
| Snowshoe .....    | 1,930 | 5,516  |
| Mother Lode ..... | 2,562 | 12,390 |
| Oro Denoro .....  | 290   | 630    |
| Other mines ..... | ....  | 21     |

Total ..... 12,653 49,210

| Roseland—                   |      |       |
|-----------------------------|------|-------|
| Centre Star .....           | 386  | 3,572 |
| Le Roi .....                | 623  | 1,582 |
| Le Roi No. 2 .....          | 82   | 582   |
| Le Roi No. 2 (milled) ..... | 100  | 360   |
| Other mines .....           | .... | 84    |

Total ..... 1,191 6,180

| Slocan-Kootenay— |       |       |
|------------------|-------|-------|
| Total .....      | 1,640 | 5,400 |

The total shipments for the past week were 15,484 tons and for the year to date 60,790 tons.

Granby Smelter receipts, Grand Forks, B. C.:—

|             | Week. | Year.  |
|-------------|-------|--------|
| Total ..... | 7,871 | 30,653 |

B. C. Copper Co.'s receipts, Greenwood, B. C.:—

| Total ..... | 4,072 | 14,240 |
|-------------|-------|--------|

Consolidated Co.'s receipts, Trail, B.C.:—

| Total ..... | 1,333 | 9,827 |
|-------------|-------|-------|

Le Roi Smelter receipts, Northport, Wash.:—

| Le Roi .....      | 623 | 1,582 |
|-------------------|-----|-------|
| Other mines ..... | 272 | 496   |

Total ..... 895 2,078

The total smelter receipts for the various smelters for the past week were 14,171 tons, and for the year to date 56,798 tons.

For week ending January 9th La Rose shipped to Denver and Copper Cliff; Nipissing to the Balbach Smelting Works, Newark; Nancy Helen, Cobalt Central, and Buffalo to Copper Cliff; Chambers-Ferland, and T. & H. B. to Denver; Coniagas to Thorold; McKinley-Darragh, and Northern Concentrators to Perth Amboy.

## MARKET REPORTS.

January 22.—Connellsville coke, f.o.b., ovens:—

Furnace coke, prompt, \$1.60 to \$1.70.

Foundry coke, prompt, \$2 to \$2.15.

## Metals.

January 22.—Tin, Straits, 28 cents.

Copper, prime Lake, 14.25 cents.

Lake arsenical brands, 14 cents.

Electrolytic copper, 13.87½ cents.

Copper wire, 15.75 cents.

Lead, 4.17½ cents.

Spelter, 5.12½ cents.

Sheet zinc, 7.50 cents.

Antimony, Cookson's, 8.10 cents.

Aluminium, 24 cents.

Nickel, 40 to 47 cents.

Platinum, \$22.50 to \$23.50 per ounce.

Bismuth, \$1.75 per pound.

Quicksilver, \$44.50 per 75-lb. flask.

## MARKET NOTES.

A writer in the Wall Street Journal ascribes the recent advance in silver prices to a speculative market. Silverware manufacturers report goods in great demand. The arts require annually between 28,000,000 and 30,000,000 ounces. The requirement will therefore be extensive.

On the other hand, Cobalt alone produces 20,000,000 ounces yearly, and as silver is a by-product of copper and lead ores, it is difficult to restrict it.

The drop in prices from the high level of eighteen months ago has been about 20 cents per ounce. From this decline must be deducted the recent rise, and no great improvement can be expected for some time.

In spite of this opinion there is evident now a marked and sustained rise in the price of silver.

# JUDICIAL SALE

## OF THE MINING PROPERTIES OF THE LARDER LAKE PROPRIETARY GOLD FIELDS, LIMITED.

Pursuant to the Winding Up Order made by the High Court of Justice in the matter of the Larder Lake Proprietary Gold Fields, Limited, and in the matter of the Winding Up Act, being Chapter 144 of the Revised Statutes of Canada, 1906, and Amending Acts, and dated the 23rd day of October, 1908, and with the approbation of George Kappel, Esquire, K.C., Official Referee, sealed tenders marked "TENDER FOR LARDER LAKE PROPERTY" will be received, addressed to "OSLER WADE, 64 WELLINGTON STREET WEST, TORONTO," Liquidator of the above named Company, up to four o'clock in the afternoon of Monday, the 8th day of March, 1909, for the purchase of the following assets of the said Company, consisting of thirty-seven mining claims, situated in the Townships of Gauthier, McVittie, and McGarry, in the Larder Lake Mining Division, District of Nipissing and Province of Ontario, and certain miner's supplies and other effects, all of which are set forth and described in the parcels hereinafter mentioned:—

### PARCEL 1.

Group of four claims around Bear Creek, in the Township of McGarry. The survey numbers and recorded numbers of the said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 79       | 1937             | L. M. 80       | 1936             |
| L. M. 81       | 1943             | L. M. 82       | 1945             |

There is a camp on L. M. 79, comprising: A bunk house, 18x20 ft.; cook house, 18x20 ft.; blacksmith shop, 12x14 ft., and a clearing of several acres. Bear Creek runs through L. M. 79, and according to a survey and an engineer's report, the creek can be utilized on L. M. 79 to develop power. Complete plans and profile of the survey and the engineer's report have been filed with the Department of Mines.

### PARCEL 2.

Group of fourteen claims near Larder Lake, in Township of McGarry. The survey numbers and recorded numbers of the said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 83       | 1965             | L. M. 84       | 1960             |
| C. E. 31       | 2132             | C. E. 34       | 1889             |
| C. E. 33       | 1883             | C. E. 36       | 1885             |
| C. E. 37       | 1887             | H. F. 35       | 2201             |
| H. F. 37       | 2018             | H. F. 38       | 1949             |
| H. F. 39       | 1961             | H. F. 195      | 1888             |
| H. F. 196      | 1884             | H. F. 197      | 1886             |

Claims L. M. 84 and H. F. 35 are subject to claim C. E. 62 so far as it overlaps. There is a well-equipped camp on said claims which consists of: One frame mill, 40x49 ft., with 18 ft. walls, and a battery of five stamps; engine house, frame, 20x30, equipped with 25 hp. engine and 35 hp. boiler, and an eject forcing pump, three-inch discharge, fully connected; storehouse, 14x20; cook house, 20x30; office, 20x30; bunk house, 1½ storeys high, 20x28; stable, 15x22; blacksmith shop, equipped, 13x15; powder house, 12x18; a wharf, 16x35, and the goods and chattels of the Company, which consist of dynamite, tools, and other miners' supplies, all of which will be sold with the said claims. In the erection of the above-mentioned buildings the purchase of the machinery and plant and installation of same, and the purchase of said goods and chattels, there has been expended upon the said claims a large sum of money.

**TERMS OF SALE:** Tenders are invited for the purchase of the five parcels "en bloc." Tenders may also be made for the parcels separately, and in case the whole property can be sold more satisfactorily in parcels, such tenders may be accepted. A marked cheque for ten per cent. of the tender, payable to the order of the Liquidator, Osler Wade, must accompany, as a deposit, the tender or tenders from each person. If a tender is accepted, twenty-five per cent. thereof must be paid within two weeks and the balance within three months from time of acceptance. The highest or any tender not necessarily accepted. The assessment work not performed to be completed by the purchaser, and the purchaser to take such title as the Company now has. The other terms and conditions of sale may be seen on application to the undersigned, and each tender shall be subject to those terms and conditions. The tenders will be opened by the Official Referee, George Kappel, Esquire, K.C., at his offices, Home Life Building, Toronto, on Tuesday, the 9th day of March, at 4 p.m.

For further information apply to the undersigned.

Dated this 26th day of January, 1909.

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

### PARCEL 3.

Group of nine claims, situated around Tonnene and Bear Lakes, and close to Larder Lake. The survey numbers and recorded numbers are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| H. S. 101      | 2035             | H. S. 126      | 2028             |
| H. S. 102      | 2034             | H. S. 191      | 2031             |
| H. S. 104      | 2137             | L. M. 85       | 2217             |
| H. S. 123      | 2029             | L. M. 86       | 2218             |
| H. S. 124      | 2030             |                |                  |

### PARCEL 4.

Group of six claims, in the vicinity of Pancake Creek, close to Larder Lake, Township of McVittie. The survey numbers and recorded numbers of said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 50       | 2071             | L. M. 53       | 2486             |
| L. M. 51       | 2202             | L. M. 54       | 2072             |
| L. M. 52       | 2453             | L. M. 55       | 2203             |

### PARCEL 5.

Group of four claims, near Fork Lake, Township of Gauthier. The survey numbers and recorded numbers of said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 45       | 2378             | L. M. 47       | 2377             |
| L. M. 46       | 2389             | L. M. 48       | 2391             |

The claims contained in said parcels have a total acreage of approximately 1,300 acres, and have all been duly and properly recorded and surveyed and survey plans with field notes attached filed with the Department of Mines. At least ninety days' assessment work has been performed upon each of the said claims. The remaining assessment work to be performed upon each of the said claims may be completed before August 1st, 1909.

An inventory of the goods and chattels of the Company and plans and photographs of the property may be seen on application to the undersigned.

W. M. DOUGLAS,  
Solicitor for Liquidator,  
70 Home Life Building, Toronto.

# A Handy Reference List

We urge you to examine the books listed below with great care. Some are brand new—all are standard. We can supply any technical book in print

## Copper

### Principles of Copper Smelting

BY EDWARD D. PETERS.

*Professor of Metallurgy, Harvard University.*  
612 pages, 6x9; cloth. \$5.00 (21s.) postpaid.

### Modern Copper Smelting

BY EDWARD D. PETERS.

640 pages, 6x9; cloth. \$5.00 (21s.) postpaid.

### Copper Mines of the World

BY WALTER HARVEY WEED.

376 pages, 6x9; cloth, \$4.00 (17s.) postpaid.

### Notes on Lead and Copper Smelting and Copper Converting

BY HIRAM W. HIXON.

128 pages, 6x9. \$3.00 (12 6) postpaid.

### Pyrite Smelting

BY T. A. RICKARD.

Formerly Editor of *THE ENGINEERING AND MINING JOURNAL*.  
210 pages, 6x9. \$2.00 (8 6) postpaid.

### Matte Smelting

BY HERBERT LANG.

98 pages, 6x9. \$2.00 (8 6) postpaid.

## Lead and Zinc

### The Metallurgy of Lead

BY H. O. HOFMAN

*Professor of Metallurgy, Massachusetts Institute of Technology.*  
600 pages, 6x9. \$6.00 (26s.) postpaid.

BOOKS BY WALTER RENTON INGALLS.  
*Editor of THE ENGINEERING AND MINING JOURNAL.*

### Lead and Zinc in the United States

6x9; cloth. \$4.00 (17s.) postpaid.  
(Price subject to change)

### The Metallurgy of Zinc and Cadmium

701 pages, 6x9; cloth. \$6.00 (25s.) postpaid.

### Lead Smelting and Refining

336 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

### Production and Properties of Zinc

328 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

## Gold and Silver

### The Chemistry of Cyanide Solutions

Resulting From the Treatment of Ores.

BY J. C. CLENNELL

164 pages, 6x9 cloth, illustrated, \$2.50 (10 6) postpaid.

### Practical Notes on the Cyanide Process

BY FRANCIS L. BOSQUI, PH. B.

*Superintendent of the Standard Consolidated Mining Company's Cyanide Works, Bodie, Cal.*

201 pages, 5½x9, illustrated, \$2.50 (10 6) postpaid.

### Stamp Milling of Gold Ores

BY T. A. RICKARD.

6x9; illustrated. \$2.50 (10 6) postpaid.

### Hydrometallurgy of Silver

BY OTTOKAR HOFMANN.

336 pages, 6x9; cloth. \$4.00 (17s.) postpaid.

## Iron and Steel

### The Manufacture and Properties of Iron and Steel

BY HARRY HUSE CAMPBELL,

*Metallurgical Engineer for the Pennsylvania Steel Company, etc.*

Entirely revised in 1907. 641 pages; 6x9; illustrated.  
\$5.00 (21s.) postpaid.

### The Metallurgy of Iron and Steel

BY BRADLEY STOUGHTON,

*Adjunct Professor of Metallurgy, School of Mines, Columbia University.*

Fully illustrated; 6x9. \$3.00 (12 6) postpaid.

### The Metallurgy of Steel

BY HENRY M. HOWE, A.M., S.B., L.L.D.

9x12; fully illustrated. \$10 (42s.) postpaid.

## The Manual of Fire Assaying.

BY CHAS. H. FULTON

176 pages, 6x9, illustrated. \$2.00 (8 6) postpaid.

Immediately upon its publication the leading assayers, metallurgists and professors of the country hailed this as the best work yet issued on the subject. It substitutes exact knowledge for the rule-of-thumb.

## Ore Dressing

BY ROBERT H. RICHARDS.

*Professor of Mining, Massachusetts Institute of Technology.*

Two volumes. 6x9; cloth, 1250 pages. Profusely illustrated. Per set, \$10.00 (42s.) postpaid.

The standard authority on all classes of ore dressing by one of the leading mining authorities of the world.

Remember—We Sell All Books of All Publishers—

# Canadian Mining Journal

313 Confederation Life Bldg.  
Toronto.

SOLE AGENTS FOR CANADA.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

Consulting Engineer and Land Surveyor  
Vancouver, B.C.  
*Surveying  
Townsites Mining Claims Timber Claims*

**MATTAIR, L. H.**  
Civil and Mining Engineer  
Haileybury, Ont.,  
and Room 1004, 346 Broadway, New York.  
Examinations and Reports.

**WILLMOTT, A. B.**  
M.A., B.Sc.  
Consulting Mining Geologist  
Sault Ste. Marie, Canada.  
Consulting Geologist  
Lake Superior Corporation

**LORING, FRANK C.**  
Mining Engineer  
Home Life Building, Toronto, Ont.  
Cobalt, Ont.

**ROLAND, WALPOLE**  
Mining and Civil Engineer, Consulting  
Engineer,  
Mem. Dom. Inst. Ama. Engrs.  
Port Arthur, Ont.

**WOODMAN, J. E., Sc.D., (Harv.)**  
Mining Geologist  
Halifax, Nova Scotia.

**E. PERCY BROWN, S. B.**  
Mining and Metallurgical Engineer.  
The Gold Mines of Nova Scotia.  
Assaying, Reporting, Managing.  
**BRIDGEWATER, Nova Scotia.**

**SCOTT, O. N., B.Sc.**  
Mining Engineer and Economic  
Geologist.  
14 King Street West  
Toronto.  
Mining Properties Examined and Reported  
Upon. Phone M. 1735.

**BAKER, C. S.**  
Assayer and Metallurgist  
Greenwood, B.C.

**LECKIE, J. EDWARDS**  
Mining & Consulting Engineer,  
Box 355. Cobalt, Ont.

**TYRRELL, J. B.**  
Mining Engineer.  
Valuer of Mines and Mining  
Properties.  
9 Toronto Street, Toronto, Canada

**BRYANT, C. M. & CO.**  
Assayers and  
Mining Engineers  
VANCOUVER, B.C.

## ASSAYERS, CHEMISTS AND ORE TESTERS.

**MILTON HERSEY Co., Ltd.**  
Chemists, Engineers & Inspectors  
**Dr. Milton L. Hersey, President.**  
Provincial Analyst, (Quebec Govt.)  
**Assays of Ores,**  
Chemical, Electrical and Mechanical Tests of  
all Materials.  
Mining Properties Examined.  
**HEAD OFFICE:**  
171 James St. Montreal

**I WILL GRUBSTAKE**  
PROSPECTOR and develop the find,  
if showing warrants. Don't waste your  
time writing me about ordinary  
opportunities; I'm deluged with such.

## THE ROAD TO GOWGANDA

BY THE  
CANADIAN NORTHERN ONTARIO ROUTE

is thirty miles shorter than any other. Beginning February 2nd. through sleepers leave Toronto, 5 p.m. arriving Sellwood (Moose Mountain Iron Mines) next morning. (Breakfast served on train.) From Sellwood to Gowganda is one day's sleigh ride over the company's own road; comfortable road houses are stationed at easy distances and a fast freight and passenger service has been inaugurated with all points in Canada. Inquiries invited:—

Wm. Phillips, General Freight & Passenger Agent,  
C. Price Green, Passenger Agent,

King and Toronto Streets,  
Toronto

## Newton & Treloar

Commercial & General  
**PRINTERS**

14 Johnson Street, Toronto

**Royal Insurance Company, Limited**  
of Liverpool, England—Founded 1845

## Courses in

1. Civil Engineering.
2. Mining Engineering.
3. Mechanical and Electrical Engineering.
4. Architecture.
5. Analytical and Applied Chemistry.
6. Chemical Engineering.

Diploma granted at the end of three year  
B. A. Sc. at the end of one additional year.

## Professional Degrees:

Civil Engineer (C. E.)  
Mining Engineer (M. E.)  
Mechanical Engineer (M. E.)  
Electrical Engineer (E. E.)  
Chemical Engineer (C.E.)

For Calendar and other information apply to the  
Secretary

A. T. LAING.

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

## Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants PROSPECTING LICENSES for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is \$5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only \$2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, \$10.00 per acre, and on lands situate less than 20 miles from such a railway, \$20.00 per acre:

Superficial products and building materials are sold \$2 and \$4 an acre according to the distance from rail road.

MINING CONCESSIONS are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed

lands; work must be bona fide begun within two years and \$500.00 spent for each 100 acre concession.

MINING LICENSES, giving the right to work the mine and dispose of its products, are granted on payment of a fee of \$10.00 and a rent of \$1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts.

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with MR. MILTON L. HERSEY, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

**The Hon. Minister of Colonization, Mines and Fisheries**  
Parliament Buildings, Quebec.

### SAVE HALF THE COST ON YOUR ASSAYS

How many samples have you sent to your assayer during the last year which showed no values? A test with Way's Pocket Smelter would cost you only five cents and could be made right in your office or in the field in less than five minutes. If your sample shows values, send it to an assayer, if not waste no more money on it.

We want you to know more about this Outfit which is saving money for so many prospectors, miners and mining men all over the world. An outfit which is guaranteed to give an accurate test on any ore of commercial value. An outfit of which one of our customers said, "is as far ahead of a pan as an electric car is ahead of a burro."

Send for illustrated folder today.

**WAYS POCKET SMELTER COMPANY**

# BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

# \$24,980,546

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

CHAS. SIMISTER,  
General Superintendent.

J. D. HURD,  
General Manager.

## OF CANADA

### Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

W. W. CORY, Deputy of the Minister of the Interior

# Montreal Steel Works, Limited

OFFICE AND WORKS :

St. Patrick St., Montreal

## MANUFACTURERS

of Steel Castings of all kinds, Springs, Frogs and Diamond Crossings

*We make a specialty of*

## Manganese Steel Castings

*for Mining purposes.*

AGENTS FOR

THOMAS FIRTH & SONS, Limited

"Speedicut" high speed steel, tool steel, axe steel, saw steel, files, etc. A large stock carried in our Montreal warehouse.

Also Agents for Barrow, Haematite Steel Company, of Barrow in Furness, England.

Steel Rails of all kinds, Fish Plates, etc.

# RAMPART CEMENT

Perfectly Sound. Never swells or bursts.

Reliable for all purposes for which hydraulic cement is used.

Fineness 92 per cent. through a 200 mesh sieve.

Strength up to standard specifications, and permanent.

Used by the leading Mining Companies of the Maritime Provinces.

## Sydney Cement Co., Ltd.

*Rampart Brand*

SYDNEY, NOVA SCOTIA, CANADA

# "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

General Passenger Department, Intercolonial Railway  
MONCTON, N.B.

# Westinghouse Motors For Mine Work

## The operation of pumps with Westinghouse Motors

will in almost all cases, excepting in very large water works, show a far greater economy than with steam-driven units. The power delivered at the pump shaft by a Westinghouse motor is at the same economical rate as that of the highly efficient engines in the power house, less the small electrical losses

## Canadian Westinghouse Co., Limited

General Office and Works, HAMILTON, ONTARIO.

Traders Bank Bldg.,  
TORONTO.  
439 Pender Street,  
VANCOUVER.

For particulars address nearest office:  
HAMILTON.  
922-923 Union Bank Bldg.,  
WINNIPEG.

252 St. James Street,  
MONTREAL.  
158 Granville Street,  
HALIFAX.

# HAMILTON POWDER COMPANY

Head Office: 4 Hospital Street, Montreal

MANUFACTURERS OF

High Explosives, Stumping Powder, Blasting and  
Sporting Powder, etc.

Safety Fuse, Electrical Fuses, Batteries, and other  
Accessories.

Three Post Magneto Electric Blasting Machine

## NOBEL GELIGNITE A New High Explosive

It always breaks cleanly to the bottom of the drill holes.  
and is free from fumes of any kind,

A letter or telegram addressed to the head office or any of the following  
agencies will receive prompt attention.

COBALT      TORONTO      KENORA      SAULT STE. MARIE  
VICTORIA, B.C.      VANCOUVER, B.C.      CALGARY      NELSON, B.C.

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

## The "Little Hardy" Coal Cutter

Holes at Floor Level or Roof Level or in any intermediate position in Coal or Dirt Band, &c.

Equally suitable for Holing and Shearing.

The Lightest Coal Cutter in the Market.

Nearly 700 Machines at work. 93 in use by one Canadian Company.

## The Hardy Simplex Hammer Drill

Weight 22 lbs. Bores 6 ft. Deep.

Automatically Rotates the Drill Steel and lows out the Cuttings  
FOR SINKING, &c.

**SOLE MAKERS**

**The Hardy Patent Pick Co., Limited**  
SHEFFIELD, ENGLAND

Stocks of these machines kept by Messrs. A. C. Thompson  
Co., Limited, North Sydney, Nova Scotia, Canada.

## WHY NOT TRY A "CLEVELAND" STOPE DRILL

### OUR PROPOSITION.

We will gladly ship you a complete equipment for trial, and guarantee that it will do more work than any similar machine on the market at less cost for maintenance.

Our aim has been to make an efficient, "fool proof" simple and durable machine, and we ask that you give us a chance to prove that we have succeeded.

**Try One with your other Drills and see the difference.**

BULLETIN 40

**The Canadian Cleveland Drill Co.**  
Limited.  
COBALT, ONT.

## **JEFFREY**

### **A 5 Electric Rotary Drill**

for

Coal, Slate, Shale, Clay, Gypsum, Rock Salt, etc.

This machine  
can be absolutely depended upon to drill any  
material which can be penetrated by an auger bit.

Bulletin X 16

Contains illustrations and complete data. Mailed  
on request.

**We Build  
Complete Coal Mine and Tipple Equipments  
including**

Electric Locomotives (Bulletin X15) Coal Cutters (Bulletin X14)  
Screws and Tipples (Bulletin X22) Car Hauls (Bulletin X21)  
Coal Washeries (Bulletin X27) Crushers & Pulverizers (Catalogue X31)

**THE JEFFREY MFG. CO., Columbus, O, U.S.A.**  
Canadian Office and Works: - **MONTREAL.**

## **CONTINUOUS COAL CUTTERS**

The Sullivan Chain Coal Mining Machine undercuts the entire face of the room or entry at one operation, without changing the position of the jacks, moving props, or lifting the machine by hand.

The Machine cuts on the bottom, leaves no uncut ribs or "sprags" at rear of cut, and is from 50 to 200 per cent. more efficient than the "breast" coal cutter.

Operated by either air or electric power.

**Air Compressors**

All standard sizes in stock.

## The A. R. Williams Machinery Co., Limited

Head Office: TORONTO, Branches: MONTREAL, WINNIPEG, VANCOUVER.

Manufacturers, Importers, and Dealers in all kinds of Engines, Boilers, Machinery and Supplies.

# Straight-Line Power Driven Air Compressors

Centre-Crank Type, Mounted on Cast-Iron Base.

This compressor is a portable self-contained machine of simple construction and compact form, made in small and medium sizes. It is suitable for any conditions where moderate quantities of air are required and where power is available, as for pneumatic tool service in manufacturing and industrial plants, stone yards, in erecting bridges and structural work, for small air lifts and in electric power houses for blowing out generators.

Built in two styles, the small and medium sizes are of the centre-crank type with outside-hung driving wheels while the larger sizes are of the side crank type with a single wheel supported between the bearings. These machines are of strong and exceedingly simple construction and the material and workmanship are high grade. The strains being taken in direct lines make the machines well balanced and smooth running. They are easily set up or moved from one location to another, the air cylinder is water jacketed.

These machines are built for vacuum pumps, for vacuum cleaning systems and other purposes, and for all pressures from one to one hundred pounds per square inch.

## CANADIAN RAND CO., LIMITED

Montreal, Canada

TORONTO, COBALT, HALIFAX, WINNIPEG, ROSSLAND, VANCOUVER.

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

## The No. 3 Deister Slime Table

The greatest advance in slime concentration attained in recent years has been accomplished by this table. Its success is emphasized by the fact that as the result of an elaborate competitive test with vanners of various makes **70 of these Tables are now in operation in the new mill of the Goldfield Consolidated Mines Co., Goldfield, Nevada**

This should draw the attention of all mill men. Send for Nos. 1, 2, and 3 Catalogues.

# DRY CONCENTRATION

## Absolutely Dustless The Behrend System

The Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor.

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

Write us for descriptive pamphlet. Forward sample of your ore for preliminary test.

Canadian Behrend Dry Concentrator Co. Ltd.  
OFFICE, Citizen Building, OTTAWA, ONT.  
Test Plant, 48½ Inspector Street, Montreal, Canada.

### GOWGANDA.

**EDITOR'S NOTE.**—The following notes were hastily thrown together barely in time to appear in this number. Our readers, we trust, will overlook the obvious lack of coherence. In our issue of March 1 a much fuller article on Gowganda will appear.

Whatever discount must be allowed for the overstatements of promoters, there is no lack of evidence that Gowganda is a most promising field for the prospector. At present the tangible results of work done are small, but, in some cases, encouraging. On several properties camp-buildings have been erected. Supplies are being rushed in. The new winter route from Sellwood (Moose Mountain), the northern terminus of a branch line of the Canadian Northern Railway, to Gowganda Lake has been completed. Sellwood lies about 38 miles north of Sudbury from Toronto. A night's journey in comfortable cars lands one at Sellwood. Here travellers are transferred to sleighs. One and one-half days' drive, through a splendidly timbered country, ends at Gowganda Lake.

Fuller details of this new route will appear in a later issue of the Canadian Mining Journal. Our present purpose is merely to draw attention to the fact that there is a new passenger and freight road to Gowganda. The Charlton route has suffered badly from congestion of freight. Both roads will be taxed to their utmost to handle the traffic.

The townsite of Gowganda is just being surveyed. Naturally no lots have yet been sold. There have been however, several fictitious sales. The unfortunate purchasers will have to be content with snow.

Meanwhile, before the exact limits of the townsite are known, many buildings have been erected. There are several hotels in full working order. Two banks are completing large log structures, their business, meanwhile being conducted under canvas. Four or five lawyers, one doctor, and several surveyors have already hung out their signs. Accommodation for man and beast is being increased as rapidly as expert bushmen can pile, log on log. A saw mill is working overtime to supply the demand for boards for flooring and sheathing.

The town is situated on the northwest extremity of Gowganda Lake. Its population may be safely estimated at from three hundred to five hundred. The daily arrivals average not less than fifty. Some of these remain in Gowganda. Others are distributed through the various mining camps that are springing into existence in every direction. The lone prospector takes his tent and supplies into the woods.

In the general vicinity of Gowganda Lake, but a trifling amount of mine development has been performed.

The camp is in the first raw stage that succeeds discovery. The deepest shaft is down not more than twenty-five feet. On many of the older properties the principal work done has been the stripping of veins and the erection of bunk-houses.

Supplies are costly, but not inordinately so. Freight is delivered from the nearest points on the Temiscaming and Northern Ontario and the Canadian Northern, over the winter trails, at the rates of three dollars and two dollars per hundredweight respectively. Hay sells for about \$70 per ton in Gowganda. Bread retails at 25 cents per loaf. Other commodities bring corresponding prices.

Yet it is evident that very soon the cost of living and the prices of supplies and labor will be reduced. Proof of this is afforded by the statement that contracts have been let for shaft-sinking at rates only slightly higher than those obtaining in Cobalt.

On several mining properties visited by a representative of the Canadian Mining Journal, camp buildings had been erected. These rough, but comfortable, log structures are the first essential. Their builders are typical Canadian bushmen, French-Canadians mostly, hardy, resourceful men who appear to revel in such work. Under a competent foreman the speed with which these men construct is astonishing.

Gowganda has not yet a mining population. Indeed very few miners are to be seen, although the country is dotted with prospectors' cabins and tents. But miners are filtering in every day. Orders for machinery have already been placed and before spring there will be a considerable demand for skilled mine labor.

No one can fairly give an opinion of the district in its present condition. The country is covered with many feet of snow. Travel, except on the beaten trails, is almost impossible. Prospecting is out of the question. Of the veins discovered before the snow fell, several show high silver contents. Statements as to the horizontal extent of vein exposures cannot be checked until next summer. But it is by no means an exaggeration to say that the diabase areas of the district are well worth prospecting and that a few excellent discoveries have already been made. Indeed from a mining point of view the country offers many inducements, not only because of present showings but also because of the large future promises indicated by these showings.

So much for Gowganda itself. Gowganda's success or failure will depend very largely upon the methods of the men who exploit the region. If the district is proved and developed sanely and quietly, we believe that the chances are good that it will repay amply whatever expenditure is necessary to open it. If, on the other hand, promoters and brokers realize fortunes out of the sale of promotion stock before development is possible, then the drama of Cobalt's early days will be re-enacted.

Continual warnings are a weariness to writer and reader. They are necessary because the crop of dupes is never exhausted. We have no wish to protect the

gambler in stocks. Our desire is to guard the *bona fide* investor, particularly the investor whose means are limited. We advise strongly that all investors seek the counsel of disinterested mining engineers. And in all cases where it is at all possible the investor should visit the mining property himself. It is no longer a matter of great difficulty to reach the new mining districts of Ontario and a journey of this sort is worth taking on its own merits.

Among the most vivid impressions that Gowganda makes upon the visitor are those of restless energy, a shrewd sense of commercial opportunities, and, especially in the mining camps, unlimited hospitality. Whilst on the streets of our cities a man may die of hunger, in Gowganda no one need go without a meal. As a contrast to this milk of human kindness, a teamster will calmly ask you ten dollars for an hour's drive.

The pioneer spirit of Canadians is exemplified in the amazing speed with which a well-equipped winter road, through 70 miles of heavily wooded country, has been finished. Work was begun in the second week of January, 1909. The road was pushed through to Gowganda before February 1st.

Gowganda may be but one section of a silver-bearing region extending far towards the west. Here is inspiration for the prospector. Gowganda may become a producer of wealth or it may prove the graveyard of hopes and reputations. It is now a realm of probabilities. The thoughtful will take pains to inform themselves at first-hand.

#### A NEW BUILDING FOR THE KINGSTON SCHOOL OF MINING.

The Kingston School of Mining is asking the Government of Ontario to provide the money to erect a much needed building for the Departments of Chemistry, Mining and Metallurgy. The Government aids the school by a substantial annual grant for maintenance and equipment; and from time to time special sums have been voted by the Legislature for building purposes. By this means the Mining Laboratory was built in 1894 and in 1900 the two buildings for the departments of Mineralogy, Geology, Physics, and General Engineering.

In the sixteen years of its existence the School of Mining has grown rapidly, so that it now has 292 students taking engineering courses. This number would be very much larger if matriculation were not rigidly enforced as a condition of admission. As the overcrowding in some of the buildings had reached a critical stage, it was decided several years ago to keep down the numbers in this way. But even under these restrictions the departments referred to have become so crowded that it is impossible to carry on the work with the usual practical efficiency, or even with due regard to the

health of students and instructors. The Board of Governors has therefore decided to appeal to the Ontario Government for a grant of \$150,000, with which to erect a home for those departments that have done so much to develop the mineral industries of the province. A deputation of friends of the School of Mining will wait upon the Government at an early date. There will be no difficulty in getting a large and representative deputation. The work of the school is well known throughout the province, and doubtless the Government will see its way clear to return for the benefit of mining education a small part of the revenues received from mining lands.

#### TRAINING STATIONS FOR RESCUE WORK.

Upon more than one occasion we have alluded to the urgent need of Government Rescue Stations in the coal mining regions of Canada. A long series of calamities has aroused the United States authorities to the point of action. The technologic branch of the U. S. Geological Survey has in hand the establishing of Rescue Stations in all the larger coal mining districts of the United States. At Pittsburgh a fully-equipped station was formally opened in December, 1908. Others are being built and equipped as rapidly as possible.

At these stations squads of men from surrounding collieries will be trained on the use of breathing apparatus and in administering first aid to the injured. In this way hundreds of miners will become familiar with the use of the devices. Hence, in course of time no coal mine in the United States should be without the means of entering the mine workings immediately after an explosion and of fighting underground fires in a manner infinitely more effective than is now possible.

Apparatus, however, is not everything. Every miner should be given an opportunity of acquiring a working knowledge of the "breather." This is essential. The untrained man is worse than useless.

We regret that Canada has not, as a nation, taken the lead in this humane work. True, one Canadian company, the Dominion Coal Company, has been the pioneer for this hemisphere. But it is certainly the duty of the Federal Department of Mines to act, and that right rapidly.

We bespeak the attention of that Department and of all Canadian coal mining companies. No further lessons are needed. We can secure the means of saving lives and an almost incalculable amount of coal. Delay is dangerous—perhaps criminal.

#### BOOKS.

The progress of the mining and metallurgical sciences is a function of the dissemination of technical literature. Technical literature is distributed in five forms, periodicals, proceedings of societies, official geological reports, text books and trade catalogues. Periodicals embody what is most timely in current literature including much

that appears in the two proceeding classes along with original articles, discussion of live topics, current news, and much miscellaneous matter. Official geological reports stand as permanent sources of reference. Text books provide a means of education in any desired department of technical work. The modern catalogue is often a mine of special information especially useful to the working superintendent.

Thus the well-stored mind must draw from all these sources. Discretion is necessary in the choice of periodicals. So far as society proceedings and geological reports are concerned the average reader takes what he can get. But the choice of text books is a weighty matter. Book reviews are not seldom mere cursory notices of the volume's contents. But, in the main, they indicate to the reader the range, scope, style, and character of the book reviewed. In all periodicals the reviews should be carefully read. Moreover mining men of all classes should add steadily to their libraries. A knowledge of books is a most desirable qualification.

#### THE WESTERN BRANCH OF THE C. M. I.

There is evidence of healthy interest in the western branch of the Canadian Mining Institute. The fourth general meeting was held at Greenwood on January 25. Here a civic reception was tendered to the visiting members.

The first new business undertaken was the drafting of three resolutions. The first of these was a resolution congratulating Mr. R. W. Brock on his appointment as director of the Geological Survey; the second endorsed the application of the Nelson electric zinc smelter for aid from the Dominion Government; the third approved of the step taken by the British Columbia Government in assisting the Nelson enterprise.

On the second day of the meeting several papers were read.

Apparently the mining men of British Columbia are working together in a manner that should be followed by the other provinces. There has not yet been a general Ontario meeting. Nor have the mining men of Quebec foregathered. Nova Scotia, through her own Mining Society possesses the machinery for deliberation and action upon exigent issues. But Ontario and Quebec lack that spirit of unity that is so essential when emergencies arise.

Very often it is impossible or irrelevant to bring before the Canadian Mining Institute as a whole, matters that affect deeply the welfare of one province's mining industry. Often also, prompt action is necessary. The need of strong provincial organizations is obvious for more than one reason.

We are of the opinion that this matter should be taken up seriously at the next annual meeting.

## OUR VISIBLE SUPPLY OF BRICK.

M. B. Baker, School of Mining, Kingston.

The manufacture of clay products is probably the oldest industry on earth, for if we go back in thought to earliest man, we find him fashioning various articles both useful and ornamental from clay. This homely industry has been much ignored by scientific men in favor of other mineral industries that appeal more readily to the imagination, speculation, or cupidity; but the eye of the economist in all countries, is now being turned in the direction of this very old yet new industry.

In the selection of structural material we must admit that timber is already, or will very soon be, a thing of the past. Steel and iron, with various forms of clay products is now playing a most important role, but the days of cheap steel and iron will soon be over also. Even in this new American continent we can already estimate our iron ore reserves, and long before these are exhausted, the use of iron will be prohibitive, except for such purposes as will not be served by any other material. That being the case something must be found to take the place of timber and iron as structural building materials to a very large extent. That substitute will undoubtedly be clay products of various forms, including cement. Indeed this industry is already the most important mineral industry in almost every country in the world. Even in this our own Dominion, whose virgin timber is very largely untouched yet, by comparing the last mineral statistics of Ontario, whose mineral products are the most widely exploited and records kept most carefully, we can see that clay products including cement form one-quarter of the value of the whole mineral output, metallic and non-metal, and employ more men than the total metallic production.

Deposits of pure clay or kaolin, the results of normal rock decomposition, are practically unknown in Canada. Glaciation has removed our residual clays, and much of our rock materials as well, but has left in their stead enormous deposits of glacial material both sorted and unsorted. The sorted clays ensure an unlimited supply of structural material in almost every part of the country. My description of the clays will apply only to the eastern part of Canada, say east of Winnipeg. Whether it applies west of Winnipeg or not, I cannot say as I have had no work with clays west of that point. My work east of Winnipeg has extended over four years, two of which were spent in a study and report entitled "Clays and Clay Industry of Ontario for the Bureau of Mines." Report part II., 1906.

Four distinctly different clays are used in Eastern Canada in the manufacture clay products. I am not including the shales here, which are used exclusively in the manufacture of pressed brick, terra-cotta, sewer pipe, and paving brick; I refer only to the loose accumulations of clay, lying almost everywhere upon our glaciated rock surfaces. Those four clays are named Erie, Red Top, Leda, Saugeen. The Erie clay yields white goods, all the others yield red.

If a line be drawn roughly from Prescott on the St. Lawrence River in a northwesterly direction, through Perth, Ottawa, Arnprior, across the Ottawa River, it will mark approximately a former height-of-land, and the position of a great ice dam, which formed about the

middle of the glacial period. The waters west of this dam were all fresh, and drained through the Hudson River Valley of New York State. East of this dam the waters were salt, and the valleys of the St. Lawrence and Ottawa rivers were filled with backed-up salt water from the Atlantic to a depth estimated at 600 feet above the present water level. The great glacial moraines were being sorted by water and west of this line we find a clay called Erie clay, high in calcium carbonate, and carrying a few fossils of fresh water organisms. East of this line, however, a contemporaneous clay, looking in every respect like the Erie, but low in calcium carbonate, and carrying only fossils of marine organisms: this clay is called Leda clay.

The Erie clay is widespread in Ontario. In Geology of Canada, 1863, we find a note on the Erie clay, as follows: "The Erie clay, with few interruptions, runs along the north shore of Lake Erie from Long Point westward to the Detroit River, and appears to underlie the whole country between this part of the lake and the main body of Lake Huron. It is again found at Owen Sound, and occurs along the Nottawasaga River, and along the shores of Lake Ontario, and as far east as Brockville." Even at that time the Erie clay had been sufficiently studied to show that it was of great extent in Ontario; but during my examination of the clay deposits of the Province, I have found the Erie clay in every county west of the line mentioned above as extending from Prescott to Ottawa, showing that the whole of Western Ontario is covered by a mantle of Erie clay which varies in depth from one foot to 130 feet, and in many places is no doubt thicker still.

The Erie clay is of a deep blue color when wet, and of an ashy-gray color when dry. It is highly calcareous, as will be seen by the analysis given below, so much so that it effervesces freely when moistened with acid. Some specimens, especially from the more westerly parts of the Province, contain as much as 30 per cent. of carbonate of lime. Most of the Erie clays which are used in the manufacture of clay products do not exceed 18 per cent. lime, but even this is sufficient to counteract the effects of as much as 6 per cent. of ferric oxide and cause the brick to burn to ferrous compounds which give the white clay. All the white brick, white tile, hollow block, etc., made in Ontario, are from the Erie clay.

### Red Top Clay.

What I have here named the Red Top clay is not a separate formation, but is simply a weathered zone on the top of the Erie blue clay. It is given a new name because it is an extremely important formation in Ontario and so far as I am aware, it has not been described before. The Red Top clay is of a dark chocolate color when wet, and is found lying immediately on top of Erie clay wherever exposed. It burns to a rich red color, instead of a white or buff color as does the Erie clay from which it undoubtedly formed through weathering.

It was formerly thought that all the red brick, tile, etc., made in Ontario, were from the Saugeen clay, or from the various shales. But this is not the case. The greater part of the red brick made in the Province, is simply the product of this upper weathered band of the Erie blue clay. The weathering extends to a very un-

even line, in some places reaching 4 feet, while in others not over a foot. The deepest spots are along cracks or joints, or following roots of weeds, shrubs or trees.

Thus we see how irregular is the contact between this Red Top clay and the underlying Erie clay. This fact leads to a great deal of trouble for those brick makers using the Red Top clay, as they are constantly digging too deeply, thereby including some of the underlying Erie clay, which causes the resulting brick to be spotted by inclusions of the white-burning clay.

From the analyses given below, it will be noticed that the lime is reduced from over 15 per cent. in the case of the Erie clays, to about 2 to 4 per cent., in the Red-top, while the percentage of iron remains about the same. The percentage of magnesia is also reduced, and the loss on ignition is also lessened from roughly 18 per cent. to about 5 per cent. All these are the result of the weathering of the original Erie clay.

With these various losses there is naturally a corresponding increase in percentage of the insoluble residues in the resulting clay. Iron oxides are insoluble in these weak solutions, therefore the percentage of ferric oxides in the new clay is a little larger as a rule. All the free silica will remain undissolved, thereby increasing its percentage in the resulting clay. Similarly with the other insoluble ingredients.

I mentioned above that the Erie clay contains much calcium carbonate. In burning this Erie clay, the calcium carbonate is broken up by heat, and carbon dioxide gas is given off, which accounts for the large percentage of loss by ignition.

In every place where the Erie blue clay is found in the Province, and exposed on the surface, a band of the Red-top clay of some thickness was found as the first mantle, varying from a few inches to 4 feet, according to the ease with which the percolating solutions could attack the clay. And in every case upon digging through the Red-top clay, the underlying Erie clay was found. We can therefore see that our supply of red-burning clay in what is usually spoken of as "Old Ontario," is quite limited, and consists of a weathered belt rarely over three feet in thickness, and on steep gradients entirely wanting. An examination of the analyses of Erie clays given below will impress one with the close similarity in their composition, though taken from widely separated sections of the country; and when we consider the mechanical means by which these clays have been formed and collected, we are surprised that such a similarity should exist.

#### COMPARATIVE ANALYSES OF ERIE AND RED TOP CLAYS (LYING TOGETHER).

|           | Red Top | 64.44             | 15.26                          | 5.96                           | 3.65  | 1.78                                   | 5.72               |
| Renfrew   | Erie    | 50.06             | 14.58                          | 4.78                           | 14.00 | 3.47                                   | 4.10               |
|           | Red Top | 54.38             | 19.18                          | 7.30                           | 4.60  | 3.20                                   | 5.24               |
| Prescott  | Erie    | 49.85             | 13.10                          | 6.18                           | 14.32 | 3.13                                   | 4.14               |
|           | Red Top | 55.34             | 19.80                          | 7.62                           | 2.18  | 2.40                                   | 5.67               |

Ordinary meteoric waters on meeting the Erie blue clay dissolve much of the calcium carbonate, carrying it away in solution. The same reactions apply to Mg. CO<sub>3</sub> but to a lesser degree. Thus we have the resulting

weathered Red-top clay, much reduced in lime and magnesia and with a corresponding diminution in the amount of loss on ignition.

The iron which was present in the Erie clay is therefore still present in the Red-top clay, and being no longer counteracted by the high percentage of lime, it is able to burn to the ferric state, thereby coloring the brick red.

#### The Leda Clay.

Turning now to the eastern part of Canada we find that east of the line described above, the clay is entirely different from that west of the line. It is a stiff blue clay, which would be readily mistaken for Erie clay. Upon examination, however, it is found to be very different, e.g., the percentage of CaO is the most noteworthy point, it rarely exceeds 6 per cent., and since the percentage of iron oxide is about equal, the burning of this clay yields ferric compounds instead of ferrous ones, and the products are therefore red in color instead of white, as in the case of burned Erie clay. This Leda clay is contemporaneous in age with the Erie, but as has been pointed out above, it was laid in salt water instead of fresh. In some places it reaches a depth as great as that of the Erie clay, e.g., at Ottawa, where the foundations were being dug for the new geological museum, an exposure of blue Leda clay was very like the great depths of Erie clay in the west. I visited these excavations on two occasions, and the contractor told me that after digging twenty feet without finding rock bottom, he had bored 94 feet and still failed to find rock. The eastern part of Canada is therefore ensured an unlimited supply of red-burning clay, but lacks the white-burning clay.

I give below a few analysis of Leda clay, and a glance is sufficient to show that it differs essentially from the Erie clays of Western Ontario.

#### ANALYSES OF LEDA CLAY.\*

| Locality              | Clay | Si O <sub>2</sub> | Al <sub>2</sub> O <sub>3</sub> | Fe <sub>2</sub> O <sub>3</sub> | CaO  | MgO  | (Na <sub>2</sub> K <sub>2</sub> )O | SO <sub>3</sub> | Loss<br>by<br>Heat |
|-----------------------|------|-------------------|--------------------------------|--------------------------------|------|------|------------------------------------|-----------------|--------------------|
| Arnprior              | Leda | 57.98             | 19.00                          | 6.18                           | 3.78 | 3.82 | 5.68                               | 0.35            | 3.18               |
| 5 miles east Arnprior | Leda | 62.06             | 15.54                          | 5.70                           | 4.91 | 3.11 | 4.30                               | 0.14            | 4.01               |
| Ottawa East           | Leda | 58.54             | 17.02                          | 5.48                           | 6.36 | 2.22 | 5.13                               | 0.56            | 3.42               |
| Ottawa West           | Leda | 56.00             | 17.07                          | 8.27                           | 4.17 | 4.55 | 4.38                               | 0.59            | 4.89               |
| Hull                  | Leda | 52.86             | 17.42                          | 8.58                           | 3.69 | 3.37 | 4.97                               | 0.58            | 5.65               |

#### Saugeen Clay.

The last of our clays mentioned above, is the Saugeen. It lies unconformably upon both Erie and Leda clay, and in many places in the northern parts of Canada lies directly on the glaciated surface of the rocks. Starting at the St. Lawrence River somewhere about the mouth of the Ottawa, if we follow the river upwards to Casselman, Ottawa, Pembroke, then cut across country to Bracebridge, Paisley, Hepworth, Walkerton to Georgian Bay, then take the north shore of Lake Huron and Superior to the Soo and Fort William, then extend on to Dryden, Kenora, etc., we will have a rough line which will mark approximately the southern border of the great Saugeen clay belt.

This clay is composed of a great number of alternate bands of "fat" clay with bands of calcareous sand, or some places, even marl. The bands of clay and sand are rarely over three-quarters of an inch thick, but this relationship is repeated so many times that banks of Saugeen clay twenty feet thick are a common occurrence and present a very unique appearance. All the Saugeen clay seen in the Province lies north of this line mentioned above, and the farther north we go, the more abundant is this clay. I have seen it from Kenora to the St. Lawrence River, and for 100 miles north of Lake

Abitibi. The great "Clay Belt" of Northern Ontario, of which we have heard so much in recent years, is composed of this clay, and the layers of sand are the immediate cause of the sandy, loamy nature of the soil of this new country, which will soon be one of our greatest agricultural districts, now that railways are built and building into that district.

In age, I would place it at the close of the glacial period, for it appears to have been formed from the flow and ebb about the edge of the retreating or melting glacier, and each two bands, i.e., a band of clay with a band of sand, together represent the accumulation for one season. During the summer or warmer months, the increased flow of water carried the clay farther out, and the sand would be deposited closer to the ice margin. In the winter or colder months, when the flow of water was lessened, a layer of clay would be deposited over the sand, and this was repeated year after year, for many years, as shown by the great number of bands in this accumulation. This process would be gradually carried back in a northerly direction as the ice-front slowly retreated and in this way we find the deposits thicker and more widespread as we go north. The few stones found in this clay—and they are extremely scarce—would be

caused by small pieces of floating ice, dropping imprisoned stones upon melting.

The Saugeen clay yields a splendid red brick on burning. The percentage of  $\text{Fe}_2\text{O}_3$  is greater than that of  $\text{CaO}$  and a good red brick results. From analysis given below it is quite evident that this clay differs entirely from either the Erie or Leda clay.

| SAUGEEN CLAY.*       |                   |                                |                                |      |                                        |              |      |

| Sturgeon Falls ..... | 65.08             | 14.83                          | 3.17                           | 4.18 | 2.57                                   | 5.00         | 5.10 |
| Bracebridge .....    | 63.00             | 15.15                          | 6.28                           | 3.48 | 2.67                                   | 5.75         | 3.63 |
| Pembroke .....       | 62.30             | 16.51                          | 5.65                           | 3.16 | 2.68                                   | 4.91         | 3.60 |
| Casselman .....      | 61.20             | 16.40                          | 6.25                           | 3.10 | 3.25                                   | 4.26         | 4.94 |

To sum up, then, we see that Eastern Ontario, and Quebec, has an endless supply of red-burning Leda clay, and no white-burning clay. Western Ontario has a like supply of white-burning clay, with only a very little red-burning weathered Red-top clay. Northern Ontario and Quebec has an endless supply of red-burning Saugeen clay and little or no white-burning clay.

\*Note.—All these analyses were made at the Provincial Assay Office, Belleville, by Mr. A. G. Burrows, for Report of Bureau of Mines, 1906.

## PRESSURE IN THE FORMATION AND ALTERATION OF COAL.

By D. B. Dowling.

Very little attention has been given to the study of the history of coal beyond, perhaps, microscopical examinations, in which traces of spores and cells of various plants have been found, and these, associated with the plant remains or impressions in the associated rocks, have been the criteria for the general deduction that most of the coal had its origin in plant remains. The alteration of this material beyond the humification stage found in peat bogs has not been extensively studied, and the results appear to have been summed up in the statement that the transformation into coal was due to pressure and heat.

The general impression that there was a great loss of gases from the mass is shown in the following quotation from Prof. Gwillim's paper "Notes on the Life History of Coal Seams":—

"In the change from bituminous coals of, say, 25 or 30 per cent. volatile matter to 8 or 12 per cent. volatile matter, there must have been a great volume of gas disposed of. It may be possible some of this becomes a solid. In any case, what becomes of the volatile matter of a coal formation carrying in the aggregate 100 feet of coal?"

"A reduction of volatile matter from 25 to 10 per cent. would mean, in such a case, 15 million tons of gas per square mile, which, figured out in volume, would be as astonishing a loss as natural gas is as a find."

This conception is based upon the experiments of heating coal in the laboratory, when the change in composition is shown by the different amounts of gas given off under atmospheric pressure. But what would happen were the coal heated under great pressure?

A probable solution is given in recent experiments

on peat, which indicate not a wasteful production of gas, but a rearrangement, in which water is the principal by-product. The first experiments—which are continued to the present day—were confined to the drying of the raw material.

Subsequently an attempt was made to improve the heat value by carbonizing or charring. This produced a better fuel, but much of the volatile combustible matter was driven off, and the attempt to make fuel out of the peat necessitated the waste of gas specified in the paragraph quoted.

A later investigator, Dr. Ekenberg, added pressure to the wet mass during the charring process, and he claims that by this process there is no loss of gas, and attributes the charring or blackening results to a chemical change by which water is liberated, and hydrocarbon compounds formed containing more carbon as the pressure and temperature are increased. Under temperatures from 150 to 250 degrees Centigrade, and pressures to prevent the formation of steam, a product was obtained which, when dried and pressed, resembles coal, and has the characters found in lignite and bituminous coals.

That there was no gas evolved in this process seems at first sight unusual, but it appears to be a fact, deduced from the chemical analysis of peat, such as some of the Swedish ones—for example, one having the following composition:—

|                |      |
|----------------|------|
| Carbon .....   | 41.8 |
| Hydrogen ..... | 7.3  |
| Nitrogen ..... | 0.8  |
| Oxygen .....   | 46.9 |
| Ash .....      | 3.1  |

100.0

Supposing the above to represent 100 lbs., we add more peat until we have 61.9 lbs. of carbon, then the mass will eventually contain the following constituents in a mass of 147.8 lbs.:—

|                    |       |
|--------------------|-------|
| Carbon . . . . .   | 61.9  |
| Hydrogen . . . . . | 10.8  |
| Nitrogen . . . . . | 1.1   |
| Oxygen . . . . .   | 69.4  |
| Ash . . . . .      | 4.6   |
|                    | <hr/> |
|                    | 147.8 |

This, when treated so that the residue has 61.9 per cent. carbon, would mean that 47.8 lbs. were excluded. If this is water, then it represents hydrogen 5.3 and oxygen 42.4, which, deducted from the above, leaves a solid compound constituted as follows:—

|                    |      |
|--------------------|------|
| Carbon . . . . .   | 61.9 |
| Hydrogen . . . . . | 5.5  |
| Nitrogen . . . . . | 1.1  |
| Oxygen . . . . .   | 26.9 |
| Ash . . . . .      | 4.6  |

A briquet of peat-coal from similar peat is reported to yield by analysis the following composition:—

|                    |      |
|--------------------|------|
| Carbon . . . . .   | 61.9 |
| Hydrogen . . . . . | 6.8  |
| Nitrogen . . . . . | 1.2  |
| Oxygen . . . . .   | 27.1 |
| Ash . . . . .      | 3.0  |

If this were from the same peat, we would have to assume a slight formation of carbon monoxide gas to make the analysis exactly similar, but it is hardly necessary.

A higher temperature and pressure has been used by the operator, resulting in the formation of a coal richer in carbon to about 65.9 per cent. Expanding our analysis of peat to the higher percentage of carbon as before, and extracting water as before, we get for this carbon content the following theoretical analysis, parallel with the published analysis of the peat and briquet:—

| Theoretical.       |       | Peat.-Coal.        |       |
|--------------------|-------|--------------------|-------|
| Carbon . . . . .   | 65.9  | Carbon . . . . .   | 65.9  |
| Hydrogen . . . . . | 5.1   | Hydrogen . . . . . | 5.8   |
| Nitrogen . . . . . | 1.1   | Nitrogen . . . . . | 1.1   |
| Oxygen . . . . .   | 23.1  | Oxygen . . . . .   | 24.0  |
| Ash . . . . .      | 4.8   | Ash . . . . .      | 3.2   |
|                    | <hr/> |                    | <hr/> |
|                    | 100.0 |                    | 100.0 |

This peat-coal analysis shows a variation which could possibly be found among the briquets from the test, and seems to point to the truth of Dr. Ekenberg's statement that there was no gas formed. These briquets are certainly approaching the true coal stage; in fact, this last analysis could be almost duplicated in a coal from Gallup, New Mexico.

It is quite possible that to conduct these experiments with higher carbon content would entail very great pressures and temperatures, above the resistance of a crucible; but the question is, does this series of theoretical analyses obtained by the extraction of water lead us through the similar analyses we get from coals? One example might be calculated for a carbon content

of 82.41, which is found in a certain coal from West Virginia:—

|                    |        |
|--------------------|--------|
| Carbon . . . . .   | 82.40  |
| Hydrogen . . . . . | 4.30   |
| Nitrogen . . . . . | 1.04   |
| Oxygen . . . . .   | 5.20   |
| Ash . . . . .      | 5.06   |
|                    | <hr/>  |
|                    | 100.00 |

The theoretical composition of the peat—expanded as for the first, and taking out water for this carbon content—would be:—

|                    |        |
|--------------------|--------|
| Carbon . . . . .   | 82.41  |
| Hydrogen . . . . . | 3.69   |
| Nitrogen . . . . . | 1.40   |
| Oxygen . . . . .   | 6.5    |
| Ash . . . . .      | 6.0    |
|                    | <hr/>  |
|                    | 100.00 |

This, in theory, is readily seen to be a very similar product, so that although we cannot apply the great temperatures, we can assume that moderate temperatures with long lapse of time when subject to great pressures, may be the equivalent of the high temperatures and pressures indicated in the above experiments, and assume that like changes had occurred in nature in the formation of the coals. No thoroughly impermeable enclosure is provided for any of the seams, and possibly no coal has been formed without some loss of gas; but there appears to be no reason to suppose that very large quantities were thus lost. If, for instance, there had been no loss of gas from the lignites, it is conceivable that these coals would be easier to briquet, or coke. It also follows that compounds formed as the result of great pressure would be less stable than those requiring lower pressure. Thus, when released from load, the lignites would not so easily throw off gas as the bituminous. If we infer that the higher the carbon content the more liability to have gas in the mine, we would be right—up to a certain point. When through small losses of gas and the using up of the oxygen and hydrogen in the production of water, this tendency is checked in the mines in which the coal is anthracite, a rapidly declining amount of gas is given off.

It is evident, therefore, that there is some relation between the pressure under which the coal was formed and the stability of the resultant compound. Up to a certain point the stability decreases with the increased pressure, after which it increases.

The most unstable compounds would then be in the coals between the lignites and anthracites; the increase in stability being more rapid through the anthracitic coals. The greatest liability for gas would seem to be in the higher bituminous or high carbon bituminous coals.

There have been accidents in the mines in the working of this hard bituminous coal which would suggest that portions of the coal were at such a critical pressure stage that when released from load the unstable compound exhibited almost the character of an explosive. There are well authenticated examples of slight shocks, such as the stroke of a pick, or a light shot—producing a “blow out” of large dimensions, with disastrous results to life. This might be caused by a disruption of the hydro-carbon compounds, whereby a new coal compound was formed of a more stable nature; but with a loss of volatile matter or gas in sufficient volume to raise the pressure suddenly and furnish the mechan-

ical force necessary to dislodge other portions of coal. With the liberation of the gas and formation of a new coal compound the latter would not be compacted, but would blow out with the gas, as dust.

It is not at all certain that gas can be generated without the solid particles of coal being expelled along with it in the form of dust of different grades of fineness.

## A VISIT TO THE MINERAL DISTRICTS OF CANADA.

Paper Read Before the Institution of Mining and Metallurgy.

By William Freecheville, Past President, and Hugh F. Marriott, Member of Council.

(Continued from last issue.)

From Moose Mountain we went on to the copper-nickel mines near Sudbury. We commenced there by inspecting the very fine smelting works at Copper Cliff, belonging to the Canadian Copper Co., a subsidiary of the powerful American corporation called the International Nickel Co., which, besides owning most of the producing mines at Sudbury, also owns the Orford Copper Works in New Jersey and a number of the principal nickel mines in New Caledonia, which latter, however, are not being worked at present.

The smelting works at Copper Cliff have quite recently been reorganized and brought up to date, and give the impression of embodying the best that money and present technical knowledge can produce. There are three large blast furnaces with a daily capacity of 500 tons each, and it was stated that about 1,000 tons of ore were being smelted per 24 hours.

Part of the ore is roasted in heaps, and then smelted with a certain amount of raw ore, forming a smelting mixture requiring only a small and occasional admixture of quartz or limestone. The consumption of coke is said to be about 10 or 11 per cent. We understood that not long ago an attempt was made to introduce pyritic smelting, but without success.

The ore smelted contained, we understood, about 6 per cent. copper and nickel, say roughly half of each, and was concentrated up to a 30 to 35 per cent. matte. The matte is tapped into ladles and taken to converters, where it is blown up to about 80 per cent.; this rich matte is sent to the Orford Copper Works in New Jersey for further treatment. The reasons were mentioned for stopping the bessemerizing at this point, one being that, if carried further, the issues by volatilization would be heavy, and the other that such a matte can be imported into the United States as raw material.

From the smelter, a short run on the railway belonging to the company took us to the Kreen Hill Mine, one of the important mines which are now supplying ore to the smelter. The Kreen Hill Mine, like the other important deposits in the district, is situated at the edge of an intrusive rock of the greenstone type called norite (quartz-hypersthene-gabbro).

The ore occurs as splashes and bunches of copper pyrites and nickeliferous pyrrhotite in the norite, and it is generally supposed that these ores were original constituents of the fluid magna out of which they separated on cooling. Granting that hypothesis, the appearance of the mine suggested very clearly that this mode of formation has been plentifully supplemented by secondary action, depositing the ore along slip-planes, cracks and fissures. The run of ore-bearing ground is said to have a width of about 200 feet, and, it is said, do not yet know what width they will ultimately find profitable to take out. Underground work is going on at two levels underneath the open-cut, which are served by an underlay shaft

which goes down in the footwall at an angle of about 60 degrees. An electric winder is used.

The ore broken in the mine is hand-sorted, hoisted to the top of the rock-house, crushed in jaw crushers, and then hand-picked as it travels on rubber belts. About 50 per cent. is said to be picked out, the waste averaging about 21½ per cent. of copper and nickel, and the ore which goes to the smelter about 6 per cent., which is made up of about 4 per cent. of nickel and 2 per cent. of copper. According to these figures, the ore as mined should contain about 4.25 per cent. of copper and nickel.

We walked for some little distance along the outcrop of the run of ore-bearing norite and were interested to see the rock smoothed by glacial action and showing a little gossan, but not so much as one would expect to see on the outcrop of such an ore body. The gossan showed no sign on the surface of either copper or nickel, and where it was being dug into, at only two spots was a little green carbonate of copper noticed.

As illustrating the importance of the Sudbury copper and nickel industry, it may be mentioned that, in 1907, 359,076 short tons of ore were smelted, and the shipments of matte contained 6,996 tons of copper and 10,095 tons of nickel.

From Sudbury we passed through the beautiful rugged scenery skirting the northern shores of Lake Superior, and leaving this great waterway at the grain ports of Fort William and Port Arthur, we passed out of Ontario and arrived at Winnipeg. This town is the centre of the agricultural area of the Dominion; its streets are extremely wide and well paved, and palatial offices and stores stand alongside of little tumble-down wooden structures which were put up when the town was first located.

The journey through Manitoba and Saskatchewan was a long vista of open prairie covered with farms, on which, for hundreds of miles, the wheat stood in stacks ready for the threshing machine. Leaving Winnipeg, the next halt was made on the borders of Alberta, at Medicine Hat, and it was here that we had our first introduction to the extensive occurrence of natural gas, which has done so much for this continent.

Mr. Eugene Coste, who has long been associated with the industry in Canada, was with us throughout the trip, and gave us very useful information on the occurrence and development of this phenomenon. His theories are at variance with those which have generally obtained as to the origin of mineral oil and natural gas. He contends that they are of igneous origin, and not, as has been hitherto supposed, due to vegetable and animal matter. The results of his experience and his successful practice are certainly strong arguments in favor of the views which he has set forth in detail in Canadian Mining Institute papers.

At Medicine Hat the Canadian Pacific Railway have

sunk a hole alongside the line to a depth of 1,050 feet to the main reservoir tapped. The capacity of the daily supply was 1,500,000 cubic feet, and, using 300,000 cubic feet per day, the pressure at the mouth of the hole was 550 pounds to the square inch. From this well they are now supplying for lighting and heating purposes, firing their boilers in the railway shops, and using the gas locally for all purposes where fuel is required.

Small high-pressure mains are laid alongside the line, and the gas is charged in the train cylinders direct for burning in the carriage lamps. We also inspected a hole that had just been compelled by Mr. Coste some distance from the above. This hole was put down about the same depth to strike the same gas-bearing stratum.

Gas was turned on to full blast into the free air for our edification. Coming through a small delivery pipe in volume amounting to 1,000,000 cubic feet in 23 hours, the roar is such that the drums of the cars are endangered unless tightly closed or protected by plugs. The gas was then lit, and produced a torchlike flame 50 feet into the air.

The method of sinking these holes is by cable drills; the casing follows the boring tools closely down until the gas reservoirs are struck. A smaller pipe is then lowered into the hole and the intervening space securely plugged with rubber packing near the bottom of the hole. The gas then be shut off to be used as required, and the pressure, when the flow of gas is arrested, in some cases reaches 1,000 pounds to the square inch. The life of a hole is a very indeterminate quantity, and the supply may give out in a matter of months or last for years.

From Medicine Hat we proceeded to Frank, and inspected the landslide which took place on the 29th of April, 1903, in which a portion of Turtle Mountain broke away from the summit and was carried across the intervening valley and up the opposite hillside, burying the river, the coal mine and part of the town of Frank en route.

The mountain consists of paleozoic limestone thrust over cretaceous shales. In the latter is a coal seam, the mining of which probably caused a weakening of the base of the afterwards displaced rock, and the presence of a fault plane and other natural causes combined to effect the dislodgment.

The extreme longitudinal limit of the slide was  $2\frac{1}{2}$  miles. The height of the peak of the mountain over the river bed was 3,000 feet, the upper part of the surface being at an angle of over 45 degrees, so that the impetus gained in the descent was immense.

The rock mass that broke away was over 400 feet thick, and measured half a mile square. After re-deposition it covered a square mile of area. Huge boulders were transported with apparently little detrition, and the smaller pieces, though showing many signs of impact one with another, presented sharp angular surfaces, as if occasioned by a fresh break. Several curious phenomena in connection with the adjoining town are worthy of note as assisting any theories on the great distance of transport of this rock; for instance, cases are quoted in which human beings were conveyed out of their houses for considerable distances comparatively unhurt.

The whole appearance of the phenomenon led us to the opinion that the transported rock had practically floated on a wave of highly compressed air to the position in which it was redeposited. This theory appeared the more justified when there were noted in various eruptions simulating the form of volcanoes which had been subsequently blown up through the mass of detritus by the imprisoned air below.

From Frank we proceeded into the coal country of the Rocky Mountains on the borders of Alberta and British Columbia. We inspected the surface plant of the International Coal and Coke Co., and the Hosmer Mines, and then continued to the town of Fernie and visited the works of the Crow's Nest Pass Co.

The coal-bearing series in this district are in the cretaceous formation, which lies directly on Devonian carboniferous limestone. The formation is traversed by longitudinal faults and tilted up by the earth movements, which have formed mountain ranges. The coal varies from lignite in the eastern or less disturbed part of the district, to hard steam coal in the centre and west of the range, where greater pressure has been exerted. The town of Fernie had been completely burned down by a forest fire a month before our visit, but wonderful progress had already been made with the work of rebuilding.

The next place visited was Moyie, on the banks of the picturesque lake of the same name. Here are situated the St. Eugene lead mines, which belong to the Consolidated Mining and Smelting Co. of Canada, the head office of which is at Toronto, and which also owns the Centre Star and War Eagle mines at Rossland, and the Trail smelter. The mineral vein exploited outcrops up the mountain to a height of 1,800 feet, and is opened to a depth of 750 feet below the lake level.

The lode formation is decidedly curious, in that there is a main lode, and a parallel lode or lodes, and curious branches or cross lodes, locally called "avenues," running between the two, which also carry ore and are very material contributors to the output. The ore is concentrated in a mill on the shore of the lake, very much on the usual lines, jigs being employed for the coarser sizes, Wilfley tables for the finer, and Frue vanners for the slimes. Several Callow shaking screens are in use, which are said to be giving satisfaction.

According to the information given, they are putting through from 500 to 600 tons of ore a day, and producing about 80 tons of concentrates containing 60 per cent. elad, and 25 ounces of silver per ton. The concentrates are shipped to the Trail smelter.

Enticed by the good values obtained by the company, some adventurers acquired from the Government the mining rights under the lake, and discarding the usual method of sinking caissons and tubbing, where water is concerned, they proceeded to build a two-compartment shaft on a staging constructed some distance from the shore, and added on their sections, sett by sett, depressing the shaft into the water by means of superincumbent weights. The shaft, when we saw it, had been firmly driven into the mud bottom; the next move in the operations has not yet been decided upon.

From Moyie we went by train and steamer along the Kootenay Lake to Nelson, thence by train to Trail, where we were conducted over the well-known smelter, where both lead and copper ores are treated. The copper furnaces are 22 or 23 feet long, and 40 inches wide, and put through from 500 to 600 tons a day each. The ores are mixed as much as possible, so as to give a smelting mixture, and but little flux has to be added. The charge carries about 40 per cent. of silica. The matte from the first smelting is granulated and roasted in O'Hara furnaces, sufficient sulphur being left to allow the material to agglomerate in Huntingdon Heberlein pots.

The lead ores are also roasted in O'Hara furnaces, and then treated in Huntingdon Heberlein pots, and smelted in a blast furnace. The lead is refined electrolytically by the Bells process, being cast as anodes in

suitable form, and being suspended in a bath of hydro-fluo-silicic acid. The lead is dissolved and re-deposited in pure lead sheets, and all impurities, including silver, fall to the bottom as a black slime. Lead thus obtained is 99.99 fine.

From the Trail smelter we went on to Rossland, where we divided into several parties and visited some of the principal mines, such as the Le Roi and the Centre Star.

At the Le Roi we were taken to the 1,650 foot level, and saw a good-looking bunch of ore, on which, however, as yet, not much length has been proved. It was understood that this point was somewhere about 300 feet from the Centre Star property, and that in that mine, at about the same level, a good body of ore extends nearly up to the boundary.

The ore produced at the Le Roi mine last year averaged 0.98 per cent. of copper, 0.29 ounces of gold, and 0.44 ounces of silver, equal to an average value of \$10.49 per ton. It appears that the main vein in the Le Roi became poor at a depth of about 900 feet, but that values have been found again on a parallel south vein below this depth.

In the Centre Star Mine the same experience seems to have been passed through, the main vein, on which there were two makes or shoots of ore, becoming impoverished in depth; but values have made again on the south vein, more or less opposite to and below the ore above.

The ore bodies, where we saw them in the Centre Star Mine, were of good size, one being about 250 feet long and about 25 feet wide. The country rock is grano-diorite, and the vein filling appears to be altered country rock carrying iron pyrites, both plain and magnetic, a little copper pyrites, and some silver and a little gold.

At Rossland we were entertained at a banquet given by the local members of the Canadian Mining Institute, the citizens of Rossland, and the Rossland Board of Trade.

From Rossland we proceeded to Greenwood, and visited the mine and smelter belonging to the B. C. Copper Co. The mine is on what is known as the Mother Lode, and is exploiting a large body of ore about 150 feet wide, having a known length of about 1,200 feet. The hanging wall is of greenstone and the foot wall limestone.

The ore appears to be altered greenstone, in which spots of iron pyrites with a little copper pyrites here and there occur. The value is said to run from 1.5 to 1.75 per cent. of copper and about \$1.50 in gold and silver.

That it should be possible to work commercially such an ore indicates the very favorable conditions that exist. The workings are partly opencast and partly underground, and no timbering is used, the ore being worked out in chambers, leaving intervening pillars. The ore is self-fluxing.

An output of about 1,600 tons a day is being made from the Mother Lode, and about 400 tons a day are obtained from other mines, so that the tonnage smelted amounts to about 2,000 tons a day. The smelter is situated about four miles from the mines. There are three furnaces 20 feet long by 4 feet wide, putting through a little over 600 tons a day each. About 12½ per cent. of coke is used, costing \$6.50 per ton. The matte runs from 45 to 50 per cent. of copper, and is bessemerized and the black copper shipped.

The next mine visited in the district was the Granby, which conducts one of the largest low-grade mining and smelting operations in the world. The plant is now being increased to treat 5,000 tons a day. The ore dips at about 40 degrees, and several drives are made on each level, from which the stopes are carried up at an artificial

angle to enable the material to be run into the trucks by gravity.

The operations here consist of blasting down the ore, which gravitates into the trucks and is drawn out of the mine by electric traction. It is then run on a down grade to the smelter, and, passing through jaw crushers, four of which deal with the entire output, it is mixed with coke and dumped straight into the furnaces.

The ore, which contains 1.5 to 1.75 per cent. copper and \$1.50 in gold and silver, is entirely self-fluxing, and it is due to this natural advantage that this extremely low grade is profitably worked.

The smelter is at present doing 3,500 tons a day. There are eight furnaces, 14 per cent. of coke being added to the charge. The resultant matte is 40 to 45 per cent.; the slag, which contains about 0.3 per cent. copper, carries 45 per cent. silica. The Bessemer process completes the operation necessary to turn out marketable copper.

An interesting detail with regard to the furnaces here was the system of charging; the trucks containing the various materials are run right into the furnace, there being auxiliary wheels on the upper part of the sides of the trucks, which engage with rails on the furnace walls. They say they mine the ore in the morning and send the copper away as 99 per cent. black copper in the evening, and although this may perhaps not be strictly accurate, it substantially illustrates the unusual simplicity and celerity of the operations.

We returned to Nelson, and were taken by steamer to the Bluebell Mine, which is a low-grade lead, zinc and silver proposition. There are three successive ore bodies which, from the shape of the stopes, appear to be in the nature of large lenses. Some fine specimens of reef gold were shown us as coming from Sheep Creek in the vicinity of Nelson.

From Nelson we proceeded to the coast via Revelstoke, passing through Vancouver without stopping, but going on direct by boat to Victoria, where we were most comfortably housed in the Empress Hotel, belonging to the Canadian Pacific Railway.

The day after our arrival we attended a meeting of the western branch of the Canadian Mining Institute in the Parliament Buildings, the meeting being preceded by short addresses of welcome by the Hon. Mr. McBride, Premier of British Columbia, and the Hon. Mr. Templeman, Minister of Mines in the Dominion Government. The chairman of the western branch, Mr. A. B. W. Hodges, then read an able and interesting paper on the Granby mines and smelter, of which large enterprise he is the general manager. The meeting was in every way a bright and successful one. In the afternoon we attended a garden party given by the Governor of the State.

We spent the next day in Victoria, and in the evening attended a reception given in the Parliament Buildings by the Premier, the Hon. Mr. McBride.

From Victoria we went on to Nanaimo to visit the coal mines there, and on the way our train was stopped a short time to enable us to take a hasty glance at the Tyee smelter, favorably situated on the seashore, with convenient wharf facilities. This smelter, which has one furnace with a daily capacity of 300 tons, is now dependent on custom ores, and at the time of our visit a cargo of copper ore from some new mines which are being opened out by a Japanese company on Charlotte Island was being smelted.

The chief coal properties on Vancouver Island are owned by Hon. James Dunsmuir, who is at present Governor. We did not, however, go to any of his mines, but inspected the surface plant of the Western Fuel Co. at Nanaimo, but did not go down the mine.

An interesting side excursion was made at the latter place to a branch of Nobel's dynamite works, which has a capacity of 500 cases a day.

We returned to Vancouver on September 25th, and, after having been shown round Stanley Park, which, except for California, has the largest trees in existence, a farewell luncheon was given us by an influential gathering of Vancouver citizens.

In the evening we left Vancouver at 5 o'clock and started on the homeward run to the east, halting the next evening at Banff, where we spent the following day, and had an opportunity of seeing the grand mountain scenery which surrounds this most beautiful spot, of bathing in the sulphurous waters of the hot springs, and of visiting the Bank Head Collieries near by, which are being worked by the Canadian Pacific Railway. This is an anthracite mine, and forms a northern extension of the coal country referred to at Fernie. A large proportion of the product is made into briquettes by mixing the fines with 9 per cent. coal tar pitch.

From Banff we continued east to Calgary, which is situated in the prairie country, within sight of the Rocky Mountain range. Here we were given a glimpse of the real Wild West in relation to the cattle-raising industry. Mr. P. Burns, whose names in foremost on the ranches of the West, had gathered together the champion riders among the cowboys, and we witnessed some remarkable feats of endurance in the struggle for mastery between these seasoned horsemen and the "outlaws," which name is given to the incorrigible buck-jumping horses. We were also given a realistic exhibition of the method of lassoing, throwing and securing wild steers by these same cowboys, and a fitting conclusion was put to an exciting entertainment by the unrehearsed effect of a liberated steer charging the assembled company, fortunately without serious results.

Thus our most instructive, entertaining and enjoyable trip came to an end. The majority of the members continued eastwards in the special train, while others branched off in various directions to their work or to visit other camps.

The impressions we received of Canada as a whole were most favorable, and this remark applies also to the country as a field for mining enterprise.

It appears to us the natural resources offer abundant opportunity for development, in which English capital might be profitably employed. Results in the past, it is true, have not been uniformly encouraging, but this was probably more due to the methods adopted than to an absence of conditions for profitable working.

American capital appears to have been more successful than English capital in Canadian mining, and it is not difficult to understand this when it is considered that one can get on the train at Montreal or Toronto in the evening and be in New York the next morning.

English capitalists would, we believe, stand a much better chance of securing some of the good things as they come along if, instead of waiting to have things brought to them in London, they had an agent or representative resident in Canada. New developments and discoveries are, in our opinion, sure to occur from time to time, and we think this prospect, together with the chances of participating in the development of already existing enterprises, should be sufficient inducement to English capital to give more attention to Canadian mining than hitherto.

We cannot conclude these notes without paying a very warm tribute of thanks and kindly feeling to our Canadian hosts and brother engineers for their great kindness and hospitality. They treated us well, made us welcome, and gave us a unique opportunity of obtaining a birds'eye view of the present state of the Canadian mining industry.

## MINE ACCOUNTING.

Written for the Canadian Mining Journal by John G. Grant, B.A.\*

### I.

I have been asked by the Canadian Mining Journal to write a series of articles dealing with the simpler phases of accountancy, showing their application more particularly to bookkeeping for mining companies.

In the effort to abbreviate and simplify my articles, some ideas which appear of considerable importance to my readers may be slurred over or entirely neglected. For this reason a careful and studious reading of these papers, accompanied by honest criticism, will be heartily welcomed, and such criticisms will receive careful attention and an answer either by letter or by inclusion in some succeeding article.

The great majority of enterprises to-day in Ontario, involving a considerable amount of capital, are incorporated under the provisions of the Ontario Companies Act. A good working knowledge of this Act is, therefore, almost, or quite, indispensable to the modern business man in this province. With this idea in mind, we will follow a company from its inception to the commencement of operations, through the Companies Act touching on the more important requisites. It must be noted that a statutory requirement is never a matter of choice, but a hard and fast rule, a transgression of which will always be accompanied by some penalty provided for by the Act.

In determining the amount of capital stock to be asked for in the petition reasonable care should be taken. A company with a huge capitalization, unless it can be shown that an enormous working capital is necessary, or the value of the properties to be purchased is very great, becomes a subject of natural suspicion in the minds of foreign and home investors. But, notwithstanding this fact, the capital must be large enough to provide for the purchase price of the property, the commissions on the sale of stock and still leave sufficient working capital to buy the necessary plant and develop the property until it is on a revenue earning basis. It is customary and conservative to set aside unsold a certain proportion of the capital stock as treasury stock by the sale of which the working capital can at any time when the need arises be supplemented. In the interval while it remains unsold no dividends will be paid on it, thus raising the average dividend on the other stock.

Having fixed on the amount for which the proposed company is to be capitalized, the Lieutenant-Governor, through the Provincial Secretary, is petitioned to grant letters patent. The petition must contain the proposed name of the company, the objects for forming the com-

\*Chartered Accountant, Toronto, Ont.

pany, the address of the proposed head office in Ontario, the amount of capital and number of shares, the name in full, calling and address of each of the applicants, of whom there must be at least five, and the names of at least three provisional directors. This petition must be accompanied by a memorandum of agreement showing the number of shares subscribed for by

each applicant following his own witnessed signature. Each petitioner must be a bona fide holder of shares mentioned in the memorandum of agreement. Accompanying the petition there must be a marked cheque payable to the Provincial Secretary, covering the amount of the fee for letters patent. A schedule of the rates charged at present is as follows:—

### SCHEDULE OF RATES.

| MINIMUM AMOUNT<br>OF PROPOSED<br>CAPITAL. |  | MAXIMUM AMOUNT<br>OF PROPOSED<br>CAPITAL. |  | FEES.    |            |                       |                           |     |
|-------------------------------------------|--|-------------------------------------------|--|----------|------------|-----------------------|---------------------------|-----|
| UP TO                                     |  | \$ 40,000                                 |  | \$100.00 |            |                       |                           |     |
| \$ 40,000                                 |  | 100,000                                   |  | 100.00   | AND \$1.00 | FOR EVERY \$ 1,000.00 | OR PART FROM \$ 40,000.00 | UP. |
| 100,000                                   |  | 1,000,000                                 |  | 160.00   | " 2.50     | " 10,000.00           | " " 100,000.00            | "   |
| 1,000,000                                 |  | UP                                        |  | 385.00   | " 2.50     | " 10,000.00           | " " 1,000,000.00          | "   |

After the company obtains the letters patent applied for, it is in a position to offer to the public for subscription its shares of capital stock. It has been found expedient in some cases to advertise the offering of such stock by means of publishing prospectuses in the newspapers or by pamphlets distributed through the mails. Too much care cannot be taken in the preparation of such advertisements. A prospectus must contain the names of the signers of the memorandum of agreement, with the number of shares subscribed for by each, the number of shares necessary to qualify as a director and provisions (if any) for their remuneration; the names, addresses, and calling of directors; the minimum subscription on which the directors may proceed to allotment; the amount payable on application and allotment for each share; the amount allotted at any previous time; the number of shares issued or to be issued as fully paid up which have been paid for other than by cash; the names and addresses of the vendors of the property to be operated by the company and the manner of payment for the property; the amount paid or payable as commission; the amount paid or to be paid for preliminary expenses; the promoters' remuneration; particulars as to any special contract entered into and the place where the contract is filed; the name and address of auditors; and the interest in the company held by directors. When the prospectus is published in a newspaper the first requirement re the subscribers to the memorandum of agreement may be omitted. All moneys resulting from such advertisements shall be held in trust until deposited in a chartered bank to be held there in trust until the company may commence business.

After the minimum subscription has been received a declaration must be filed with the Provincial Secretary

that shares have been allotted to an amount not less than the minimum subscription mentioned, and that every director has paid in cash a proportion equal to the proportion payable on application and allotment by other subscribers. The Provincial Secretary will then give the company a certificate entitling them to commence business.

At least one month after the certificate has been received, and not less than three months after, a general meeting must be held, at which a report certified by at least two directors shall be presented. This report must contain the total number of shares allotted as fully or partly paid up otherwise than in cash, and the consideration for such allotment; an abstract of receipts and payments on capital account and a statement of preliminary expenses; the names and addresses of the directors, auditors, manager, and secretary, and the particulars of any special contract requiring ratification or discussion. The statements relating to cash and capital account should be certified by the auditor and filed with the Provincial Secretary. A list showing the names of all shareholders' addresses, etc., and number of shares held by each should be accessible to any shareholder during the meeting.

To take care of all these transactions dealing with the capital stock certain books must be kept. One of these is a plain ruled book called the Minute Book, wherein are kept the minutes of the above-mentioned meeting and all subsequent meetings, both of directors and shareholders. In this book should be pasted a copy of the letters patent. Books ruled as below must be kept to record the names of all persons who are or have been shareholders, the address and calling of each shareholder, and the name, address and calling of each directors, with date of beginning and ending of his holding office as director:—

### LIST OF SHAREHOLDERS

| DATE | NAME | ADDRESS | CALLING | Folio |
|------|------|---------|---------|-------|
|      |      |         |         |       |

## List of Directors

| DATE OF ELECTION | NAME | ADDRESS | CALLING | DATE OF RETIREMENT |
|------------------|------|---------|---------|--------------------|
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |
|                  |      |         |         |                    |

A book must also be kept to record any transfers of shares taking place, as a transfer is not valid until entered in the books of the company. Below is a simple ruling for such a book:—

## REGISTER OF TRANSFERS

| Folio | NAME OF TRANSFEROR | DATE | SIGNATURE OF TRANSFEROR | AMOUNT OF STOCK | Folio | NAME OF TRANSFEREE | ADDRESS | CALLING | SIGNATURE OF TRANSFEREE |
|-------|--------------------|------|-------------------------|-----------------|-------|--------------------|---------|---------|-------------------------|
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |
|       |                    |      |                         |                 |       |                    |         |         |                         |

A Stock Ledger to show the number of shares held by each shareholder and the amount paid in and remaining unpaid by each is also required. The ruling of the Ledger is shown below:—

NAME \_\_\_\_\_  
 ADDRESS \_\_\_\_\_  
 CALLING \_\_\_\_\_

| DATE | PARTICULARS | NO OF Shares Acquired | FOLIO | NO OF SHARES TRANSFERRED | NO. OF SHARES HELD | CALLS |      |               |       |             |      |                |  |
|------|-------------|-----------------------|-------|--------------------------|--------------------|-------|------|---------------|-------|-------------|------|----------------|--|
|      |             |                       |       |                          |                    | DATE  | RATE | AMOUNT CALLED | FOLIO | AMOUNT PAID | DATE | BALANCE UNPAID |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |
|      |             |                       |       |                          |                    |       |      |               |       |             |      |                |  |

To this Ledger are posted all entries from the List of Subscribers and the Register of Transfers, and all payments of cash on account of stock subscribed for and called. The headings of the different columns are sufficiently explanatory in themselves to make the entries quite simple.

These four books, with the Stock Certificate Book, must be kept in the head office of the company in Ontario.

The certificates of mining companies issuing shares at a discount must have printed on them in red ink "Not subject to call," or "Subject to call," as the case may be. The words "No personal liability" must

also appear on their seal. To issue shares at a discount a by-law must be passed and confirmed by a majority of the shareholders at a special meeting fixing the rate and conditions of the issue. Within twenty-four hours a copy, verified by affidavit of President and Secretary, must be sent to the Provincial Secretary by registered mail or fyled within five days in the office of the Provincial Secretary.

Returns must be made before Feb. 1 in every year, including particulars as follows, covering a period up to Dec. 31 next preceeding the date of the report. The returns shall include the name of the Company, the manner of incorporation, the board of directors ad-

dresses, etc., the date of the last annual meeting, the place of the head office, the amount of the capital and how divided, the number of shares subscribed for and allotted, the number of shares issued, fully paid for, other assets, the amount of calls, amount of shares forfeited, the rate of discount on sale of stock, whether a sworn copy of by-law providing for the sale of stock at a discount was sent to the provincial secretary and date of same; and, lastly, an alphabetical list of shareholders. A copy of this report shall be pasted up in the head office to be left until replaced by the next report. The report must be sworn to by the president and secretary. I give here a list of fees for filing this report together with one or two other fees which are to be paid.

|                                                                                  |        |
|----------------------------------------------------------------------------------|--------|
| Filing annual reports of a company with capital of up to \$50,000.....           | \$2.00 |
| Filing annual reports of a company with capital of \$50,000 to \$100,000.....    | 3.00   |
| Filing annual reports of a company with capital of \$100,000 to \$1,000,000..... | 5.00   |
| Filing annual reports of a company with capital of \$1,000,000 up.....           | 10.00  |
| Filing by-law providing for sale of stock at discount.....                       | 2.00   |
| Filing certificate to enable company to commence business . . . . .              | 25.00  |

In order to show more clearly the bookkeeping relating to the sale of stock we will assume that all calls have been made and paid and the cash received and transferred from the trust company to the bank.

A special case book recording the receipts or capital account should be kept, with two columns, one headed *cash received* and the other headed *discounts*. The sum of the cash and discounts opposite each name is posted to the proper account in the stock ledger into "amount paid" column, balancing the accounts. The total of the cash column is entered in the General Cash Book and from there posted to the credit of capital account. The total of the discount column is put into the proper accounts by means of the following journal entry:

Discounts on sale of stock, Dr.  
To capital account

"Discounts on the sale of stock" account is charged with the total discounts allowed and capital account is credited with a like amount. Capital account will thus be credited with the total subscribed and paid up stock. The debit to discount on the sale of stock account must not be confused with the ordinary business discounts, but must be kept separate. It may be treated in either of two ways. It may be included in preliminary expenses and written off over a period of years. But this is not necessary for as it will never become a realized loss unless the company goes into liquidation, it may be carried as an asset shown in the balance sheet as a deduction from the subscribed and paid up stock.

If the purchase price of the property was partly in cash and partly in paid up stock the following entries must be made—*property account* is charged with cash paid through the *General Cash Book*. *Property account* is also charged with the amount of stock transferred to the vendors and *capital account* credited with a like amount by means of the following journal entry:

Property account, Dr.  
To Capital Account

The bookkeeping we have already done gives us the following results. The stock ledger shows what stock is held and by whom and what is unpaid on the stock if any. The general ledger shows a debit to *property account* for the purchase price of the property; a debit to *discounts account* for the discounts allowed on the sale of stock, and a credit to *capital account* for the total amount of subscribed stock. The General Cash Book shows a debit balance for cash on hand and in bank.

We will let the banks stand as they are while I endeavor to show in my next article how transactions taking place at the mines are recorded and what books are necessary there.

While the main principles of the Ontario Companies Act are common to the several other Companies Acts throughout the Dominion there are certain points of difference which will receive due notice in a following article. There will also be shown the requirements necessary for an extra-provincial company to commence business in Ontario, etc., and for foreign companies to commence business in Canada.

(To be continued).

## SINKING OF WABANA SUBMARINE SLOPES.

By R. E. and A. R. Chambers.

Published as an advance paper of the Canadian Mining Institute.

In June, 1893, the first landing on Bell Island was made by one of the writers, accompanied by the Butlers of Topsail, Nfld., who then owned the property, for the purpose of examining the iron ore beds.

After a lunch of flatfish and fresh lobsters procured from a nearby fishing boat and cooked on heated stones on the beach, an examination of the outcrops was made.

It could be seen at a glance that the property was valuable. Fifteen years of continuous working have produced striking changes: Then, the north side of the island a forest of fir trees, requiring a compass to guide one; the south side dotted by scattered primitive farms; now, the smoke from many boilers providing steam for the vast machinery employed, the rattle of drills, the sharp exhaust of many engines, groups of

houses where live part of the 1,500 employees, attract the eye and ear, and replace the silent forest. The roar of loading ore, the many-toned whistles of steamers, the hum of moving cars are heard from the homes of the old settlers, part fishermen, part farmers.

Such is the change wrought by the working of the ore upon the island. Nor is the change confined to here. Sydney, a quiet town, the citizens exchanging kindly greetings on the sunny grass-grown streets, is now transformed to a bustling cosmopolitan city, overshadowed by the giant works of the greatest steel plant in Canada. Across the harbor a group of huge furnaces and machine shops encircled by a network of many miles of track, and surrounded by a busy town of 7,000 people, replace at Sydney Mines a former barren plain.

The ore deposits and plant on the land at Wabana have been fully described in previous articles, so that a further reference is not here necessary; but recent developments carried on under the direction of the writers, in connection with the submarine areas, have proven to have an important bearing on the size of this ore field, and point to changes greater than those above referred to.

It has been shown that the ore upon the land is but a fringe of the greater deposits beneath the sea. The fact of a quantity equalling the entire requirements of the Scotia furnaces having been steadily mined from the submarine areas during the last six months is good proof of the practicability of working the ore.

In view of the importance of these results, a short account of the developments may not be uninteresting.

#### Historical.

On the organization of the Dominion Iron & Steel Co. a sale was made by the Nova Scotia Steel & Coal

An agreement was made by which slopes could be driven by the Scotia Company through the submarine areas of the Dominion Company. The point selected was the continuation of the No. 2 Slope, already being worked on the upper bed. At the shore line here there was cover of 68 feet, which was greater than at any other point east or west. The dip of the vein being 8 degrees to the north, or direction in which the work progressed, made it possible to commence the work with the plant then installed until the practicability of the enterprise should be determined. It was known that at distances of about 250 and 1,000 feet respectively serious faults would be encountered, and it was not considered advisable to make any expenditure for plant until these should have been passed.

Work was commenced on May 21st, 1906. In August the first fault was encountered. Fortunately, although this dislocation amounted to an upthrow of 29 feet, with only 85 feet of strata intervening between the workings and the bottom of the ocean, the quantity

Co. to them of the bed of ore upon the land then being worked by the latter, known as the lower bed, reserving for themselves the upper bed on account of its superior quality. This sale included a submarine area of three square miles adjoining the shore. Subsequently outlying submarine areas were acquired by the Scotia people, which from the great depth of cover, it was thought would be quite workable over a large area. On account of the known persistence of the beds in this district these submarine areas would probably contain all the beds known to exist on the land.

Upon the submarine areas each company owns all the beds upon their respective claims, whereas on the land the lower bed is owned by one company and the upper bed by the other.

As the work progressed additional areas were procured, so that at the present time there are thirty-two square miles owned by the Scotia Company and five and half by the Dominion.

of water struck was trifling.

From a study of the rock structure upon the land it was pretty evident that this upthrow would be followed by a corresponding downthrow after driving about 800 feet, running northeast and southwest, approximately at right angles to the fault first encountered. It was consequently decided to continue the slope in the strata underlying the ore in order to maintain as uniform a grade as possible. The wisdom of this course was verified by encountering the ore beyond the second fault at the distance and height expected, and of greater thickness. This fault was more serious, containing 4 ft. of clayey decomposed rock, and an increased flow of water. The soft ground was handled by careful spiling and the water could easily be handled by two No. 6 Cameron pumps, the quantity not exceeding 80 gallons per minute.

Beyond this second fault no serious difficulties were encountered for a further distance of 1,800 feet, at

which point a downthrow fault of 26 feet was reached. The cover had increased to a total of 293 feet, and in consequence a greater feeling of security was felt in handling any difficulties which might occur. With the increased depth, however, was a corresponding increase in firmness, and the clay encountered in previous faults was not met here. The slope was continued in the strata overlying the ore, but with an increased grade for a distance of 400 feet, when ore was again entered with a normal thickness, and a normal dip of 12 per cent. The grade for the 400 feet was made 20 per cent., which by trimming will be subsequently reduced to 18 per cent. For this 400 feet the effects of the fault were felt in the increased tenderness of the roof, necessitating timbers being placed skin to skin, and in the amount of water dripping from above. The total quantity of water was, however, in no way formidable. After re-entering the ore bed beyond this fault, no difficulties have been encountered to the date of writing. The bed has the normal dip of about 12 per cent., the ore has a section of 9 feet, and the quality is fully maintained.

On entering the Scotia areas at a distance of nearly 4,000 feet from the shore the conditions are as favorable as could have been hoped for, and more so in that the quantity of water being handled is very small compared with what was expected.

The advances are as follows:—

Slope commenced May 21st, 1906. Distance driven to December 31st, 1906, 704.6 feet; distance driven to December 30th, 1907, 1,916.1 feet; distance driven to December 24th, 1908, 3,965 feet. The month of least advance was August, 1907, in passing first fault, or 42.5 feet. The month of greatest advance was November, 1908, or 247.81 feet. In the four weeks from the 16th of November to the 14th of December an advance was made of 270.1 feet. In the week ending December 7th, 1908, an advance was made of 72.5 feet. This gives a record of 11¼ feet per day for a month, and 12 feet 1 inch per day for a week. The size of excavation for this driving was 13 feet to 15 feet wide by 8 feet high.

A system of bonus payments for rapid advance greatly helped in attaining above results.\*

#### Plant.

**Boilers.**—The power used in sinking cannot be considered apart from the mining plant, as part of it is used for each purpose. The boiler plant consists of 5 batteries of Sterling water tube boilers of 234 h.p. each and 16 upright tubular boilers of 42 hp. each.

**Air Compressors.**—One Nordberg duplex compressor, cross compounded air and steam, jet condenser using fresh circulating water, direct connected to low pressure crosshead of the compressor; steam cylinders, 18—32x42; air cylinders, 19—29x42; capacity, 2,500 cubic feet of free air per minute. One Walker compressor of same type; steam cylinder, 22, 42x48; air cylinder, 23½, 38x48; capacity, 3,500 cubic feet of free air per minute; the exhaust steam is conducted to a surface condenser, using salt water from the sea for circulating water. One straightline Norwalk compressor, compound steam, compound air, with a jet condenser using fresh water; steam cylinder, 14—22x24; air cylinder, 14½—22x24; capacity, 1,200 cubic feet of free air per minute. The total capacity of air compressing plant is 7,200 feet of free air per minute.

\*Note.—Since above was written an advance of 74 ft. per week has been made.

**Hoisting Engines.**—In the early part of the work the hoisting was done by the engine connected with No. 2 Slope, being a 14x18 double cylinder, Flory single friction drum. As the work advanced it was necessary to supplement this by the addition of a 10x12 double cylinder, double-drum Lidgerwood hoist, placed at the mouth of a shaft sunk near the shore for this purpose, and by an 8¼x10 double cylinder single friction drum operated by compressed air, placed in a crosscut from the advancing slopes.

**Ventilating Plant.**—This consists of a 4-foot and two 3-foot Sturtevant fans. The 4-foot fan is direct connected to a vertical air-driven fan engine, and is located near the upper parts of the slopes, just at the bottom of the present workings of the No. 2 Mine, of which these slopes are a continuation. This fan is placed in the air course, and is operated exhausting. The two 3-foot fans are placed as described below.

The intention was to sink the slope by double entry. In practice, however, it was found that the tendency was to place most importance upon the slope farthest advanced, with the result that it finally exceeded the secondary or ventilating slope by a distance of 2,900 feet. To provide for ventilating this long single slope recourse was had to spiral riveted galvanized iron pipe, connected with two Sturtevant blowers, with suitable by-pass connection, so that they could be used either as blowers or exhausters. One of these was placed at the upper end of the pipe, and the other reinforcing it about 1,000 feet farther down. The first pipe used was 15 inches inside diameter, and was found to be too small to give entirely satisfactory results. Below the lower fan 18-inch pipe was installed, which still continues to give a plentiful supply of air to the face of the slope. As the slope advances new lengths of pipe are added. On account of the blasting the pipe cannot be laid nearer than within 150 feet of the face, but no inconvenience whatever is felt in working at the face for this reason.

**Pumps.**—At the bottom of the old mine and near the top of the submarine slopes is an 18x8x24 duplex Jeansville pump of their pot valve anthracite pattern. This pump can be operated by either steam or air. The cylinders are so proportioned that it can be moved to a greater depth, where the head will be greater, if required. The water is delivered through a 6-inch pipe to a drainage tunnel running to the shore.

After passing the second fault the increased water was handled by two Knowles sinking pumps 12x6x13 and 10x5x13. These delivered the water to the shore direct, or to the lodgement of the Jeansville pump, as desired. These were afterwards replaced by a 12x5x12 duplex Jeansville anthracite pattern pump, subsequently to be moved to a greater depth. The working face was kept dry by two No. 6 Cameron pumps working alternately, and latterly by a No. 8 Cameron, the water not exceeding 50 gallons per minute.

**Dams.**—To protect No. 2 Mine from possible inundation sites for mine dams were constructed at a point situated vertically below high water mark. When approaching this point the face was narrowed to 6 feet, and then gradually widened again, forming a V. No reduction was made in the height. The sides, top and bottom were lined with concrete. A small pipe was placed in the roof as an outlet for air when pressure should come on the lower side of the dam, and capacious air and water pipes were built into the floor. Timbers to fill the openings were made of 10x10 pine

Scale -  $\frac{1}{8} = 1 \text{ ft}$

## ARRANGEMENT OF

IN SUBMARINE SLOPE

NEWFOUNDLAND

Scale -  $\frac{1}{8} = 1 \frac{1}{2}$

tapering to 6x6 and piled at the mouth of the slope in the same position they would occupy in the dam, and carefully protected from the weather.

**Piping.**—The air line is 8 inches as far as the workings in No. 2 Mine and to the large Jeansville pump, and 5 inches for the rest of the submarine slope. The water discharging line is 6 inches, being double from the large pump to the surface.

**Testing Air Pipes.**—The air pipes of the sinking and working mines are periodically tested, as follows: All pipe ends are carefully closed as near to the drills as possible. A pressure gauge is connected to the section to be tested. The section is then filled from the mains, and the supply valve closed. The air in the line is then released until the gauge reads 50 lbs. The time is taken and the pressure allowed to drop by leakage until it reaches 40 lbs., when the time is taken. The loss in cubic feet of free air will be approximately half the volume of the pipe tested. This divided by the time will give the loss per minute. The amount of pipe in each section not being often changed, this can be easily kept track of. The conditions, with the exception of the time, will be practically constant. The pipe fitter is thus constantly familiar with the condition of his pipes. Corrections for temperature would be necessary for accurate results, but in practice are not needed.

**Cars.**—The cars used are of steel, of 30 cubic feet capacity, holding from 1.7 to 1.8 tons of ore, the gauge 2 feet.

**Tracks.**—The tracks are of 28 lb. rails, except near the face, where an 18 lb. rail is temporarily used.

**Protection from Runaways.**—Every tramming section of the slope is protected by a heavy swinging gate, the posts of which are securely hitched in the floor and roof and heavily braced to the walls. Each gate is operated by a boy.

The face is protected by two ordinary swinging Sampson posts placed from 50 to 100 feet back and moved alternately as the work progresses.

A safety switch is also placed a few hundred feet below the brow of the deckhead.

**Telephone System.**—Telephones are installed in the slopes, connecting through a central office with all parts of the works, the office and the houses of the manager and underground manager.

**Inspection.**—There is a daily inspection of cars, ropes, pulleys and all machinery.

#### Method of Working.

Three eight-hour shifts are worked. When the air is cleared of smoke from the last shot, the drillers and loaders proceed to the face. The drillers and their helpers begin to assemble their drills and columns, while the loaders employ themselves in throwing back the ore from the face. The drills, of which there are two on this shift, are then set up four feet from the face and about twenty inches from the rib or side, and each puts in five 12-foot centre cut holes, B 1, 2, 3, 4, 5, and C 1, 2, 3, 4, 5, respectively, completing the round in about 6 hours. The holes are blown out with compressed air when the shift is completed. After having cleared away the face for the drillers the loaders, six in number, clear off the track and run in a trip of three cars. They load up the ore that has been thrown up the slope by the previous blast, which sometimes is as much as 100 feet from the face. When the ore is reduced to a heap behind the drillers one car only is used, and the loaders relieve each other car about, three at a time. The loaders generally finish at the same time as the drillers. Forty to fifty tons is an average shift's work.

The blasters then load the holes drilled with 7 lbs. of 50 per cent. Acadia dynamite in each, tamping them securely with paper cartridges of clay prepared for the purpose. After the wires and blasting machinery are tested for strength and circuit the round is fired. If the work has been done correctly, the centre cut will be taken out as shown in the sketch, and the ore thrown well up the slope. Owing to the heavy burden on these holes they will be only about half shot out. A little high pressure air is turned on at the face immediately after the blast, and the exhaust fans described above speeded up. In the course of a short while the air at the face is quite clear, and while still a little warm, work can be resumed.

The next shift then begins, loaders clearing face as before.

The usual drillers now set their bars four feet back from the face and as close to the rib as possible, and drill holes A 1, 2, 3, 4, 5, and D 1, 2, 3, 4, 5, 12 feet deep. In addition to these two spare drills are set up in the cut and drill holes E 1, 2, 3, F 1, 2, 3, G 1, 2, 3, and H 1, 2, 3, respectively, 6 feet deep. As the extra drills do not come on the same shift each time, there are two spare drillers on each shift, and when not employed at this work they are kept busy repairing and advancing ventilating pipes, swinging Sampsons, etc., and other odd jobs.

The order of blasting is now more elaborate than on the previous shift, and on the care taken in this work greatly depends the advance to be gained.

They first load and fire first holes F 1, 2, 3, and G 1, 2, 3, 3 lbs. to a hole. Next they fire the old bottoms of holes B 1, 2, 3, 4, 5, and C 1, 2, 3, 4, 5, with 3 to 5 lbs. each, according to necessity. The third round is E 1, 2, 3, and H 1, 2, 3, 5 lbs. to a hole, and finally A 1, 2, 3, 4, 5, and D 1, 2, 3, 4, 5, are fired, 5 lbs. to a hole. This makes a total of about 200 lbs. of 50 per cent. dynamite to an advance of  $8\frac{1}{2}$  to 9 feet, according to the success of the work done.

The method of using short bars and setting up the drills on top of the ore heap was tried for some considerable time at first, but it was found that while saving a good deal of time in handling the ore, in the long run it did not pay.

The storage, thawing and distribution of the explosives for both the mines and the submarine slope is carried on at a central station, which comprises a small magazine, thawing house, with detached boiler-room, and a shed for testing detonators, located at convenient distances apart.

The thawing is carried on in a small stone building, brick lined and wood faced inside, with an air space between the brick and stone, and the building is provided with a large entry for the reception and disposal of the explosive. The heating system is the ordinary hot water system as used in dwellings. The radiators are placed in wooden boxes to prevent accidental contact of the explosive.

The various blasting crews, wiremen, thawer, magazine storekeeper and detonator tester are all under the supervision of an explosive inspector, who constantly inspects all operations connected with the use and disposal of all explosives, and who immediately reports to the underground manager any unusual occurrence, and, if possible, the cause of the same.

Credit is due to the following officials of the company at Wabana, as well as their subordinates generally:—

Frank Burrows, who succeeded one of the writers

as resident manager upon his taking up the designing of the permanent equipment for these slopes.

Laughlin McLean, who in the capacity of underground manager has been connected with the work from the beginning, and whose energy contributed greatly to the success.

John Cunningham, acting for the greater part of the time as mechanical superintendent, and for a short while David Fraser in the same capacity.

T. G. McKenzie, who is in charge of the surveys, and W. L. Hunter and E. Rees as draughtsmen.

#### Results.

As a result of the work above described it has been

proven that, as anticipated, an enormous field of ore, under Conception Bay, multiplies many times the ore previously known.

There have been mined from about  $1\frac{1}{2}$  square miles upon the island about 7,000,000 tons, and there remains yet to be mined about 25,000,000 on this land area in the beds of both companies.

One of the beds has been followed without deterioration in size or quality for three-quarters of a mile, under the sea, into the areas of the Scotia Company. It is probable that the other beds extend there also.

The claims of this latter company cover an area of about 33 square miles, the greater part of which is probably underlaid by iron ore.

## Recent Progress in the Mineral Industry in the Thunder Bay and Rainy River Districts.

Before dealing with the progress made in the mineral industries in these two districts during the past year, it might prove of interest to readers of the Canadian Mining Journal to commence with a brief resume of the past history of the districts as regards mining. This synopsis must of necessity be exceedingly short, the purpose of this article not including anything in that direction of any great extent.

With what degree of justice the district of West Algoma can lay claim to having given the first impetus to the mineral industry of the entire province it is impossible for me to prove at the present moment, but this much may be positively asserted, that the mining history of this district dates farther back by many years than that of any of the mining camps of Ontario, either now being worked or which had been active in the past.

To quote a single example, the discovery of silver in the Thunder Bay District dates back to 1866-67, at which time the Shuniah and Thunder Bay mines were first opened up. In the following year the famous Silver Islet vein was added to the mineral discoveries of the district.

Two years later, in 1870, another of the precious metals, gold, was discovered in Moss Township, near the western boundary of Thunder Bay District, the first exploitation being at the Huronian Gold Mine, which attained some fame later on. This mine has the distinction of being the only mine in Ontario which has produced gold in the form of sylvanite, a telluride of gold, in any appreciable quantity. For the next few years after the discovery of this mine, our prospectors must have rested upon their laurels, for we hear of no new discovery of mineral being made until 1879-80, at which time, during the progress of the construction of the C. P. R., gold was found on Hay Island in the Lake of the Woods. Although this discovery should have given the frontiersmen of our province an incentive to prosecute further search for the same precious metal, we hear of no new discoveries being made until 1887, in which year the Gold Hill deposit was brought to notice.

In the meantime some further important finds of silver were made by Indians, and disclosed by them to the white men, as, for example, in 1882, the Rabbit Mountain, in 1883, the Palisades, a year later, the Silver Mountain, and 1885 the Beaver Mountain Mine. Although at this period the attention of prospectors

was generally devoted to gold and silver in preference to other metals, yet in the year 1887 another Indian added the so-called Atikokan iron range to the mineral discoveries, and about five years later the Matawin iron range was discovered, although the southeast margin of this range had already become known a few years previously, attracting, however, very little attention at the time.

After this a brief interval occurred during which the search for and discovery of minerals was at a standstill, until, in 1894-5, gold was found in the Rainy Lake, Sawbill Lake, and Island Falls region. This aroused considerable excitement, lasting for several years, and, had it not been for ignorance and stock-jobbing, the common but unwholesome concomitants of legitimate mining, we might to-day have the gold mining industry of this district in a flourishing condition. The little gold boom created by these finds found an echo in the Lake of the Woods and the Manitou districts, in the former of which activity lasted for some years, while in the latter the earlier activity was continued longer, owing principally to the discovery of the phenomenally rich vein at the Laurentian Mine.

Some three years ago the discovery of hematite in the Township of McTavish, in a locality now known as the Loon Lake District, caused considerable excitement for some time. As a matter of fact this was only a re-discovery of ore that had been first found in the earlier times when silver mining was at its height; at that date, however, it was regarded as being of little importance, silver being the only metal which was being searched for and desired.

In this connection it may be mentioned that the author, soon after his landing on the shores of Thunder Bay, about 20 years ago, recognized the identity of this rock-formation, here called the Animikie, with that in which the iron ore deposits of the Mesabi, Gogebic and others are located. He drew attention to this fact in a number of papers, notably in the one entitled "The genesis of the Animikie Iron Range." How slight, however, was the attention paid by the iron mining public to these publications may be gathered from the complete inactivity which to-day prevails in the direction of prospecting this formation for hematite deposits. The blame for this condition of affairs rests, however, not only upon the shoulders of the iron miners, but perhaps still more heavily upon those of our engineers and geo-

logists, who, either as the result of imperfect examination, or failure to recognize the character of these rocks, have completely ignored the fact of their identity with the rock formation of the American iron ranges. And for this reason the Animikie iron still awaits the work that shall awaken it from the slumber of ages.

I am compelled to register a somewhat similar complaint with regard to our Matawin range. Perhaps the largest low-grade iron range in existence on earth, which still lies idle as a silent witness to the lack of foresight on the part of our iron men. Not one of them has given a thought to the possibility of mechanically converting a large part of these deposits from a low-grade, non-bessemer ore into a very high-grade concentrate of the most desirable quality for steel pig. It reflects very little credit upon our Canadian iron men especially, that they have not made any effort to remedy the existing condition that, in our whole country, we do not possess one single good-sized body of ore, of which we confidently may assert that it is of bessemer grade.

In Sweden, Norway and Finland, where similar deposits exist, they are extensively worked and the ore is concentrated and converted into high-grade briquettes almost free from deleterious elements. Similar works exist even as far north as the Arctic Circle, where German capital, always on the alert to improve home industry by securing raw material in the cheapest possible market, has immense works under construction, of which one example is at Sydvaranger, where a plant is being built capable of converting 1,800,000 tons of 38 per cent. magnetite into 800,000 tons of ferric oxide briquettes. Why should not we in Canada follow this example and treat our Matawin iron ore as we see being done by those other nations, since it is to us of far greater importance, owing to the fact that we possess no high-grade ores and are in consequence compelled to go to the United States for raw material which we could provide ourselves in any quantity and for centuries to come?

But I fear that the editor of this journal will now be asking what recent progress I have to report in the mining and winning of the various kinds of ore? What must my reply be? The financial depression of last year has borne so heavily upon the mining industry of our two districts that I can say very little indeed about their progress in this regard; if, however, I am permitted to include the prospecting for and discovery of new ore deposits in this report, then I am able to announce some progress. Why, indeed, should not this be included and termed progress? Every little addition to our knowledge in this respect, and every stroke of hammer and pick means a step forward-towards the ultimate goal, the economical winning of these ores, and hence is to be regarded as progress in mineral industry.

#### Iron.

Since the Atikokan Iron Co. blew out their furnace at Port Arthur last year no iron ore was mined or shipped in either of our two western districts, but this inactivity in no way discouraged the work of the prospectors who were seeking for iron ore. These men were especially active along the line of the new Transcontinental Railway, where, first in the neighborhood of Buda, and later along a tract extending westward as far as Ignace, bog iron ore was discovered two years ago. Exploration was most successful at places where the ground was low and favorable for the formation of little ponds and lakes, into which the waters charged with iron, flowed and deposited their contents therein.

The latter settled among the peat-forming plants and these combined with the sand, which was similarly carried in, to form little beds of a brown, ochery, hydro-ferric oxide. Although, on account of the width of the area over which the deposits were found, a great number of claims have been taken up, nothing has yet been done to demonstrate the existence of this ore in larger beds, such as would be needed to make its operation a commercial success.

I learn that somewhat better results have been obtained farther north, along the line of the same railway, north of Sturgeon Lake. Here it is said that extensive beds of magnetite have been rediscovered. I use the word "re-discovered" because specimens of this ore have been repeatedly sent down from this region, many years ago, and reached my laboratory through the employees of the Hudson's Bay Co. or other fur traders, they having received them from trappers. In this region a very large number of claims were also taken up, from which, since they are situated only a very few miles from the line of the national transcontinental railway, the owners expect to ship ore down to the lake ports as soon as the road is completed.

Further prospecting for iron ores has been carried on along the southern extension of the Matawin range, where some American parties were using the government diamond drill to prosecute the work, but no results are at present available. At the western extension of the Atikokan Range some activity has been witnessed during the past year, the Oliver Iron Mining Co., of Duluth, having had three diamond drills at work in the search for magnetite, but as regards their success in their operations I have been unable to learn anything.

The same must be said regarding the results of some work which has been carried on by the government diamond drill a few miles farther west, near the outlet of Steep Rock Lake. This drill has been working upon an outcrop of ore which was considered to belong to the deposits of brown hematite of which a considerable number of floats were found scattered over that region some years ago. These floats were apparently an iron of great purity, containing hardly any phosphorus, sulphur or silica, but sometimes having an appreciable amount of manganese.

Some sporadic prospecting has been going on along the margin of the Animikie rocks, northeast of Port Arthur, in the hope of discovering red hematite, and the results here seem to have been identical with those reached in the vicinity of Loon Lake.

#### Silver.

The only signs of activity in mining for silver were those displayed in an attempt to open up the old Beaver Mine, and to build in connection with it a new stamp mill for treating the ore which the owners anticipate discovering in the mine and also in the old dump. The mine is now closed.

#### Gold.

In the numerous localities throughout our two districts, where gold occurs, the year 1908 has witnessed but little activity, with the exception of a considerable amount of prospecting work along the shores of Sturgeon Lake, where a large number of prospectors enlivened the stillness of these northern waters with drill, pick and hammer. If the numerous rich samples which came from that region are any criterion, the results must have been gratifying to the workers, a fact which is still further borne out by the large number of claims that have been taken up there during the past summer.

As yet another exception to the general inactivity, I might quote the Manitou country, where, in the early part of the year a considerable incentive was supplied to the large number of claim owners by the knowledge of the great richness of the Laurentian Mine. They were thus encouraged to prospect their possessions and, wherever veins of some promise were found, to commence development work. This work has to some extent been carried on, but I believe that lack of capital has been the only reason why more has not been heard of results in this direction, and better results been attained.

In the well-known gold-bearing area around Mine Centre, on Rainy Lake some good finds of rich ore are reported to have been made last summer, and I am hoping that these, together with the rich veins already known to exist, will shortly make Mine Centre once more the busy mining camp which it was several years ago.

In order to accomplish this, here and elsewhere, it is above all things necessary that the stock jobbing habit, of which I have so often complained, shall be completely done away, and that the monies realized from the sale of mining stock shall be put into the mine and not diverted into the pockets of speculators, promoters and others. Had this been done in years gone by, West Algonia would be able to show to-day a good many paying gold mines.

F. HILLE, M.E.

Port Arthur, Jan. 1, 1909.

### THE BRITISH MINT IN 1663.

The indefatigable Mr. Samuel Pepys, whose diary became an involuntary contribution to the history of his times, has left on record a surprisingly accurate account of routine and methods that obtained in the British Mint in the seventeenth century. The entry dated May 19, 1663, in Mr. Pepys' diary includes lengthy notes on the assaying, testing, and coining operations then in vogue.

On this May morning Pepys and his friend, Sir John Minnes, paid a visit to the Tower. Here they were shown the method of making the coin of the realm. So much was Pepys impressed with what he saw that he carefully noted every step and made transcriptions in his diary. Part of Pepys' entry must be quoted here: "After dinner went to the Assay Office and there saw the manner of assaying of gold and silver, and how silver melted down with gold do part, just being put into aqua-fortis, the silver turning into water, and the gold lying whole in the very form it was put in, mixed of gold and silver, which is a miracle; and to see no silver at all but turned into water, which they can bring again into itself out of the water. And here I was made thoroughly to understand the business of the fineness and coarseness of metals." With the remark that "the most observable in the making of money which I observed to-day is the steps of their doing it," Pepys proceeds to outline these steps. For the benefit of the reader, it has been thought best to paraphrase part of his description. This robs it of much of its flavour; but the immediate object of this short article is not literary, but technical.

1. Mr. Pepys explains the first steps with great minuteness. "Before they do anything they assay the bullion." To assay gold bullion, equal quantities [here Mr. Pepys is inaccurate] six and one-half ounces Troy of both gold and silver were wrapped up in lead foil.

If silver alone were to be assayed, a like quantity was taken. The assays were then placed in "little earthen cupps made of stuff like tobacco pipes, and put . . . into a burning hot furnace, where, after a while, the whole body is melted, and at last the lead in both is sunk into the body of the cupp, which [meaning the lead] carries away all the copper or dross with it, and left the pure gold and silver embodied together," or "the silver alone in these when it was put alone in the leaden case."

The process of "parting" was now in order. "To part the silver and the gold in the first experiment, they put the mixed body into a glass of aqua-fortis, which separates them by spitting out the silver into such small parts that you cannot tell what it becomes, but turns into the very water and leaves the gold at the bottom . . . with the silver wholly spit out, and yet the gold in the form that it was doubled together in when it was a mixed body of gold and silver, which is a great mystery; and after all this is done to get the silver together out of the water is as strange." Thus Mr. Samuel Pepys, in the year of our Lord, 1663, marvels at the mysteries of science. The solution of silver in nitric acid and the subsequent precipitation of that silver in the form of a chloride fill him with wonder. Also his curiosity is aroused. Accepting the disappearance and re-appearance of the silver as inexplicable, he determines to learn all that he can of the objects and logical relationship of succeeding operations.

Elucidating matters further, Mr. Pepys continues: "The piece of gold that goes into the furnace twelve ounces, if it comes out again eleven ounces, and the piece of silver which goes in twelve and comes out again eleven and two pennyweight, are just of the alloy of the standard of England. "If either the gold or the silver came out above these weights, "they are so much above the goodness of the standard, and so they know what proportion of worse gold and silver to put to such a quantity of the bullion to bring it to the exact standard." Conversely, if the assay proved the bullion to be beneath the standard, a suitable proportion of fine metal was added. Incidentally, the diarist alludes with pride to the fact that in the matter of standards that of Seville was the best, and that of Mexico worst, adding, "and I think they said none but Seville is better than ours."

Melting the standardized bullion into long plates was the next step. "If the mould do take ayre, then the plate is not of an equal heaviness in every part of it, as it often falls out."

Then, "to bring them to an even thickness all along and every plate of the same thickness," the plates were drawn between rollers. "It is very strange," observes Pepys, "how the drawing it twice easily between the rollers will make it as hot as fire."

In another pair of rollers the plates were drawn more exactly to a uniform thickness.

Then, fifthly, they were cut into round pieces, "which they do with the greatest ease, speed, and exactness in the world."

Next these pieces were weighed. Such as were overweight were filed down. Those that were underweight were set to one side, doubtless to be re-melted.

In passing the rollers the plates were bent and crumpled, and the round pieces often inherited these defects. "Therefore," writes Mr. Pepys, "they have a way of clapping 100 or 200 together into an engine,

which with a screw presses them so hard that they come out as flat as is possible."

The eighth step is brevity itself. "They blanch them."

Ninthly, "they mark the letters on the edges, which is kept as the great secret by Blondeau, who was not in the way, and so I did not speak with him to-day." It may be explained here that Peter Blondeau, a Frenchman, was the inventor, or the improver, of the method of coining by the screw-press. He was brought from France to London in 1649 expressly to improve the coinage. By the jealousy of the Company of Moneyers, his work was delayed for four years.

Lastly, the coins were milled. Mr. Pepys dwells upon this operation with such quaintness that he demands fuller quotation: "The mill is after this manner: one of the dyes [dies], which has one side of the piece cut, is fastened to a thing fixed below, and the other dye . . . to an engine above, which is moveable by a screw, which is pulled by men; and then a piece being clapped by one sitting below between the two dyes, when they meet the impression is set, and then the man with his finger strikes off the piece and claps another in, and then the other men pull again and that is marked, and then another and another with great speed. They say that this way is more charge to the King than the old way, but it is neater, freer from clipping or counterfeiting, the putting of words upon the edge being not to be done (though counterfeited) without an engine of the charge and noise that no counterfeit will be at or venture upon, and it employs as many men as the old and speedier. They now coin between £16,000 and £24,000 in a week."

The screw-press, fed by one man, a coin at a time, and actuated by three or four laborers; the crude assay equipment; the disproportionate weekly addition to the nation's wealth—all these things sound unreal when compared with the modern mint. Yet, in its day, the screw-press was considered a formidable affair, and the mint of 1663 no doubt aroused more genuine wonder than can be excited by any mint of to-day.

#### BULLETIN 359. UNITED STATES GEOLOGICAL SURVEY.

This bulletin deals with the magnetite deposits of the Cornwall type in Pennsylvania. These deposits occur near the edges of the belt of Mesozoic rocks which enters Pennsylvania along the Delaware River above Trenton, N.J., and extends across the State in a general southwesterly direction to the Maryland line.

Of the many formations which are comprised in the whole of the Pennsylvania Paleozoic section only the Cambrian quartzites, Cambro-Ordovician limestones, and the Ordovician shales occur in the region here under discussion. In the bulletin these are designated as sandstone, limestone, and shale, respectively. These formations extend over a belt of country from 10 to 20 miles wide, lying southeast of the Allegheny Front.

The Mesozoic strata, made up principally of coarse-grained red sandstone and red shale, are distributed in a belt from 8 to 12 miles wide, extending from the Delaware River southwesterly to the Schuylkill, thence westward to the Susquehanna, and again southwestward to the boundary between Pennsylvania and Maryland.

The zone comprising the various Mesozoic basins is

characterized by intrusions of diabase or surface flows of basalt, both of which are commonly called trap rock.

The ore deposits described in the following pages are intimately associated with the intrusive masses of diabase, and most of them are contained in calcareous strata either in Paleozoic limestone, outcropping near the edge of the Mesozoic belt, or in the beds of limestone conglomerate that locally mark the base of the Mesozoic section.

The ores are essentially magnetite, but they contain pyrite in amounts which make it necessary to roast them before they can be used in a blast furnace. Some specular hematite occurs in certain of the mines, but the amount of this mineral is relatively unimportant.

The ore occurs in large and small masses of varying form, either entirely enclosed by stratified sedimentary rocks or lying in such rocks where they come in contact with masses of intrusive diabase.

The iron content of these ores is extremely variable, but as the ore is mined probably averages not far from 45 per cent. Rather constant chemical characteristics are low phosphorus, high sulphur, silica, lime, and magnesia, and the presence of copper. Small amounts of cobalt have been found in some samples.

These deposits lie, in York County, in the Mesozoic strata, and in most of the other localities in limestones or limy shales of the Paleozoic age.

The geologic features of the various deposits which have been studied are thought to warrant the following general suggestions to those who in the future may make practical explorations for new ore bodies in this field:—

1. Ore bodies are to be sought only on or near the walls of masses of diabase.
2. Large masses of diabase are more favorable for ore deposits than smaller masses.
3. Cross-cutting intrusions and highly inclined sills are more favorable than sills of low inclination.
4. Limestones and limy shales are far more likely to be replaced by ore than clay shales or sandstones.
5. Particularly favorable locations for ore are found in masses of limestone that lie between bodies of diabase and beds that are in a marked degree less susceptible than limestone to the metamorphosing influence of igneous rocks.
6. The most promising situations will be found at places where the largest number of the above-stated favorable conditions occur in combination.

#### EXCHANGES.

**Industrial Progress, January, 1909, Vol. 1, No. 1.**—This new periodical, beautiful typographically and profusely illustrated, summarizes, by means of extracts from current magazines, progress made in power installation, mining machinery, pumping machinery, ventilating fans, etc., etc. The address of Industrial Progress is P.O. Box 1580, Milwaukee, Wisconsin.

The first article, "The Hydro-Electric Development of the Great Northern Power Co., Duluth, Minn." should be of particular interest to Canadian users of power.

**Mining and Scientific Press, January 23, 1909.**—A bill has been introduced into the California Assembly for the appointment of an inspector of mines. The Mining and Scientific Press, while it recognizes that the movement indicates growing interest in mining, alludes to the danger of premature action. The bill in

question endows the inspector with no positive authority. One section provides that the proposed official be liable for damage suit in case any person is "aggrieved, injured, or damaged by reason of the failure of said inspector to perform the duties herein required."

"The appointment," our contemporary remarks, "of a mine inspector without power would be to create a ridiculous supernumerary, to be fed at the public crib; to endow him with authority unrestrained by specific regulations enforceable under adequate penalty would be to let loose an autocrat who would inevitably discover a money-value for mildness in his edicts."

**The Engineering and Mining Journal, January 30, 1909.**—The Engineering and Mining Journal discusses the copper situation in this issue. Production of copper, it asseverates, is going on at a greater rate than ever before. Consumption is still below the normal. Yet there has been gross exaggeration of the stock of unsold copper. That stock is much smaller than has been supposed. "The world's stock of copper is not yet so big as to be a great drag on the market for a long time after consumption regains its normal rate. The question is simply how long we have got to wait for manufacturers to begin to buy."

**The Iron and Coal Trades Review, January 22, 1909.**—In summing up the situation of the American iron and steel industry, the Review asserts that the expectations and plans of American producers have been much modified by the past lean year. "It remains probable that a large part of the American productive capacity is likely to stay idle for a considerable period. Producers seem content with the condition . . . since there seems to be little desire to reduce prices in the hope of stimulating demand. A year's experience has shown that the policy of maintaining prices by a general understanding has a sounder basis than a mere verbal understanding through conference between the leaders. There is much more fear of unbridled competition than ever before."

### BOOK REVIEWS.

**Untechnical Addresses on Technical Subjects.** By James Douglas, LL.D. 12 mo. v+164 pages. Cloth, \$1.00. Second edition, with additional addresses. John Wiley & Sons, 43-45 East Nineteenth Street, New York.

The name of Dr. James Douglas is familiar to most of our readers. Several of his articles have appeared in the Canadian Mining Journal. For years he has contributed largely to the best technical literature of the day. As the administrator of large mining and metallurgical interests he has been phenomenally successful. One of the chief causes of his success has been the fact that he has always been keenly in sympathy with modern methods, and has constituted himself the apostle of the open door in the practical arts.

A long life of arduous professional and administrative work, profound reading, wide observation, cannot, alone, fit a man to write as Dr. Douglas writes. To these Dr. Douglas adds a rare qualification, a lofty conception of the duties and privileges of citizenship. This is the dominant note in the small volume under consideration. The author's own words express best his own ideals. Addressing the students of the Michi-

gan College School of Mines, in 1904, on the subject of wastes in mining and metallurgy, he concluded with these words: ". . . it will elevate your whole conception of the dignity of your profession and your work, if you regard yourselves, which indeed you should be, as the preservers of the gifts with which a beneficent Providence has stored our world; for next to being a creator, the highest function a man can attain to is being a saver—a saviour."

But Dr. Douglas is not merely an idealist. He writes of the broader national and international aspects of transportation, industries, and education. He correlates these activities. He traces the prodigious achievements of the nation down to the individual. He follows the efforts of the individual up to the total achievement of the nation. His essays are imbued with philosophical discernment and with practical sense.

Of "Untechnical Addresses" there are five, namely, "The Characteristics and Conditions of the Technical Progress of the Nineteenth Century," "The Development of American Mining and Metallurgy and the Equipments of a Training School," "Wastes in Mining and Metallurgy," "Some of the Relations of Transportation to Mining and Metallurgy," "Secrecy in the Arts."

All of these addresses are worth reading. To the student they will prove inspiring. To all classes of readers they will bring information set out in straightforward English and pleasantly seasoned with the ripe wisdom of a long and useful career.

### CORRESPONDENCE.

#### ON THE ORIGIN OF COBALT-SILVER DEPOSITS OF NORTHERN ONTARIO

Discussing, in a recent number of the Mining Journal, an article on the above subject, Mr. J. B. Tyrrell criticizes especially the description of some of the veins, the suggestion as to the origin of the silver, and the use of the term vein for certain fissure fillings.

Our descriptions do not agree because we were not describing the same type of vein. The difference of opinion concerning the origin seems to be one of terminology rather than of processes. I hope, therefore, to satisfy these criticisms by presenting more detailed description of the veins, and of the processes involved in their formation.

Since Mr. Tyrrell has suggested the use of the term "dyke" for some of the fissure fillings, and shows a preference for the term pegmatite, I add a few remarks in support of the term "aplitic vein."

#### Varieties of Argentiferous Veins in Diabase.

For purposes of discussion, it is of advantage to have in mind the chief types of argentiferous veins found in the diabase, and of these there are at least six fairly distinct ones.

Type 1. The fissure filling is chiefly cobalt and nickel arsenides with varying amounts of calcite. Silver occurs as a later crystallized constituent, disseminated through these minerals. These veins are but a few inches in width.

Type 2. The filling is chiefly silver or its compounds. These are generally very narrow and in some cases little more than films on the joint planes.

Type 3. The filling is chiefly coarsely crystalline calcite, with silver minerals in the cleavage cracks.

Type 4. The filling is fine grained aplitic material, chiefly feldspars with some quartz and calcite. The

silver is intimately associated with the calcite which is irregularly distributed.

Type 5. The filling changes more or less gradually from fine grained portions like type 4, to coarse grained portions, chiefly calcite.

Type 6. The filling is partly fine grained, like type 4, distinctly marked off from coarse grained calcite portions.

These are not the only types found in the diabase, but they indicate the chief varieties examined by the writer. In some cases the filling at different parts of the same fissure is not of the same type.

Type 4, 5 and 6 are especially prominent in the Elk Lake area. The aplitic veins of type 4 are of nearly the same grain from wall to wall, indicating that the fractured diabase was still quite hot when these fissures were filled. In some cases the walls are not distinct, indicating in these instances that the diabase mass had cooled but little, if any, below its melting point—these are typical “contemporaneous veins.” Type 5 indicates a gradual change in composition of the fluid filling on cooling, the feldspars being deposited, for the most part, before the calcite. Type 6 indicates a re-opening of the fissure after it had been sealed with aplitic material.

#### Differentiation in the Diabase Magma.

Mr. Tyrrell's statement that the idea of “concentration of the ores by magmatic differentiation” is “distinctly at variance” with my descriptions of order of formation of the vein minerals, implies a use of the term magmatic differentiation which I did not suggest.

The diabase has been fractured by stresses developed on cooling and the fissures filled with various minerals, some of which are of the types described above. Some clue to the origin of the solutions which intruded the fissures is afforded by an examination of the various rocks with which the ore deposits are associated.

In all parts of the district the silver veins are associated with diabase sills which are similar in composition and apparently of the same age. In the diabase there are small intrusive masses which are more highly feldspathic. These are apparently the result of contraction, fracturing, and resealing of fissures, due to cooling of an originally homogeneous magma, which had a chemical composition differing but little from that of the diabase.

There has been apparently no igneous activity since the complete solidification of the diabase magma. I have suggested, therefore, that the silver and cobalt were present in that hot solution, which was composed largely of the constituents of silicates, etc., with some water vapour and other gases. When, on cooling, the greater part of the magma had solidified the minor, still fluid portion contained a higher percentage of salic components (forming feldspar and quartz), water vapour, carbon dioxide, silver, etc. Such differentiated fluid materials were tapped by the opening of fissures in the cooling solid mass. According to local conditions of pressure and temperature, and the mobility of the materials, they escaped through or were deposited in those fissures. The feldspars were apparently deposited, for the most part, at high temperature in the diabase fissure. Other constituents in some cases escaped to the surrounding rocks. Some deposition was doubtless caused simply by loss of heat, some by mixing with the ground waters. According to the character of the rocks penetrated by the metalliferous solutions, and the nature of the fissures in them, the ores were there more or less concentrated.

The type of differentiation suggested as the cause of primary segregation of the silver is evidently not the same as that differentiation which is supposed to have been such an important factor in the formation of the Sudbury nickel deposits and some magnetite deposits. In the suggestion concerning the silver ores it is implied that the silver was in solution after most of the magma had solidified. In the primary concentration of the Sudbury ores there was apparently such fractional crystallization that ores separated in the solid form from a molten magma, and by gravitation and other forces were collected before crystallization of the other constituents took place.

#### Veins and Dykes.

I fail to see any advantage in using the term dyke in the sense suggested by Mr. Tyrrell. If the fissures were all of the composite nature described above as type 6, and if the metallic minerals were entirely confined to the coarse calcite portion it would be convenient to speak of the metalliferous and non-metalliferous portions by different names. But the veins are not all of this type, and some silver is found in the fine grained aplitic portions.

The use of the term “dyke” implies a mode of formation and a shape which are not well exemplified by these veins.

#### Aplitic and Pegmatite Veins.

There seems to be due an explanation for the double nomenclature applied to the highly feldspathic veins.

In masses of igneous rocks of various kinds there are frequently found veins which differ from the main mass in being lighter in color, and which are highly siliceous and aluminous in composition. Dark colored ferromagnesian minerals are present in small quantities or are entirely lacking. Many of these veins are apparently formed by intrusion of more acid products of differentiation in the magma.

The most common veins of this kind occur in granites, and they are known as aplites or pegmatites according to their texture.

The aplites are typically fine-grained and have quartz grains more or less round in outline.

The pegmatites are typically coarse to very coarse grained, and show peculiar regular intergrowths of quartz and feldspar known as graphic structure.

In the granites these veins consist almost entirely of alkali feldspars and quartz. In other rocks the composition varies according to and is determined by that of the parent mass.

Most of the feldspathic veins in the diabase examined by the writer are fine grained. Several specimens from James Township and Anima-Nipissing Lake, examined microscopically, show textures similar to that of aplites. The chief minerals present are feldspars, quartz, calcite and chlorite, plagioclase, feldspars predominating.

It would perhaps be useful to employ a more definite term in referring to these veins, which have not the same composition as the aplites occurring in granites. Similar veins in gabbro masses in the North Urals have been described by Duparc.\* He has named them plagiaplites, a term which might well be used by us.

While most of the feldspathic veins examined by the writer are aplitic, there are doubtless in the district

\*Arch. Sc. Phys. et nat. Geneve, 1902, 6 fevr.

veins of similar composition which have textures more like that of pegmatites.

R. E. HORE,  
School of Mining, Kingston, Ont.

Bridgewater, N.S., Jan. 6, 1909.

Editor, Canadian Mining Journal.  
Toronto, Ont.

Dear Sir,—I have read with much pleasure in your issue of Jan. 1 an article by Professor H. E. Haultain, entitled "The Mill Test for Gold versus the Assay; a Comparison in the Methods for Non-Technical Men."

The great advantage of having such papers before us is that it brings out the ideas of practical men and enables us to get at the best methods by comparing the results of our individual experience.

I do not know to what class of ore the writer refers, but, if he includes free-milling gold ores generally, I must strongly disagree with him as to the accuracy of his deductions. I refer particularly to the free-milling gold ores of Nova Scotia on which I have had continuous experience along these very lines for the past twelve years.

In the first place I do not think it fair to assume in comparing the relative merits of the two methods, that one is made carelessly and the other carefully, unless it is so stated at the beginning of the paper.

There is no reason why the mill test should not be in as competent hands as the assay.

Professor Haultain says, "The accuracy of the recovery of the gold from the plates depends on the skill and care of the man in charge." Does not the accuracy of the assay also depend on the skill and care of the man in charge?

He also says, "The very greatest care is needed before and after a test to clean out the box (mortar) and this cleaning out is a troublesome affair and even under the best conditions cannot be thoroughly done." I know that this can be thoroughly done, even as thoroughly as the mould can be emptied of its charge. Of course there is no question as to the loss in the tailings from the mill, but surely a careful mill test would hardly be complete without a careful sampling and assay of the tailings.

I fully endorse Prof. Haultain's statement regarding the importance of correct sampling. But sampling has its limitations. I do not agree with him that when you are dealing with free-milling gold ores a spoonful can always represent a car load, even with proper methods and proper care.

In comparing the accuracy of the mill test and the assay, why should the writer assume that the sample for the former is taken at random and for the latter carefully?

During the past three or four years I have been carefully following the work of one of our largest gold mines by assays of the ore as exposed in the working faces of the mine. It was found that although these samples were taken as carefully as possible, always taking large samples, usually in duplicate, the results did not accurately represent the value of the ore. They did, however, serve, in most cases, as an excellent guide. On the other hand a small 5-stamp mill installed about a year ago, particularly for this purpose, gave excellent results.

I wish it to be clearly understood that I do not underestimate the importance of careful sampling and assaying as a guide to future work; but where at all possible

this should be followed and the results checked by mill tests.

In conclusion I wish to refer to a paper by Professor H. Richards and E. E. Bugbee, of the Mass. Inst. of Technology, entitled "School Laboratory Work: A Free-milling Gold-Run." (Transactions A. G. M. E. 1904, pp. 478-486). The comparison of the assay versus mill-run as a basis of valuing a free-milling gold ore is very clearly shown in this case, where both are carried out with equal care and accuracy, as can always be done if it is insisted on.

Their results are exactly in line with my own experience on the same class of ore, except that in sampling the working faces of a mine the same degree of accuracy could not be obtained as in the case referred to. For the benefit of those who will not be able to refer to Prof. Richards' paper, I will quote a portion of his concluding remarks.

"As the value of the ore obtained by the mill run is much more accurate than that obtained by the assay \* \* \* In fact one of the objects of this work is to show the student *the impossibility of valuing a free-milling gold ore by sampling and assaying.*"

Very truly yours,

E. PERCY BROWN.

#### PERSONAL AND GENERAL.

Mr. J. B. Tyrrell and Mr. J. C. Murray, of Toronto, left on a week's trip to Gowganda on Feb. 2nd.

It is reported that Neil J. Gillis, M.L.A., will be appointed Deputy Inspector of Mines of Nova Scotia.

Mr. Frank Shepherd, of Nanaimo, has been appointed inspector of coal and metalliferous mines for British Columbia.

Mr. Frank C. Loring has been appointed to the position of consulting mining engineer to the Wetlauffer Lorraine Silver Mines, Limited.

Mr. Geo. Gray, of Stellarton, assistant general manager of the Acadia Coal Company, was nominated by the Liberals of Pictou as the candidates for the provincial election to be held February 16th, but owing to business reasons was unable to accept.

Mr. Thos. Reid, identified as sales manager of the John Bertram & Sons Co., Limited, for many years past has moved his headquarters to Montreal where he will be associated with the Canadian Fairbanks Co., Limited, the general sales agents of the Bertram Co. On account of the importance of the Montreal machine tool market this move is evidently an advantageous one to both the Bertram Co. and the Canadian Fairbanks Co.

#### INDUSTRIAL NOTES.

J. M. Pipe and Boiler Insulation Catalogue, No. 100.  
H. W. Johns-Manville Co., 100 William St., New York.

This well-illustrated catalogue shows the many uses of asbestos and magnesia products. The firm of H. W. Johns-Manville Company has had fifty years of experience in the manufacture of asbestos and magnesia products. Pipes, boilers, and furnaces absolutely require coverings in order to avoid the loss of radiation and condensation, and thereby reduce the cost of fuel, which is a very large item in modern manufacturing.

This catalogue deals with coverings for high and medium pressure pipes, cold water pipes, hot air furnace pipes, with some special coverings for pipes used for brine and ammonia. It is just as important that boilers, domes, and cylinders should be covered as that pipes should be protected in order to prolong the life of the metal. For such use sheets and blocks of various thicknesses according to the pressure, etc., are recommended. The sheets and blocks are finished with half-inch coat of asbestos or magnesia cement filling. There is included in the catalogue a price list for the coverings, blocks, cements, etc.

After exhaustive trials with five different types of rescue apparatus—British and foreign—at the Howe Bridge Rescue Station, near Atherton—the largest yet erected in the United Kingdom—the Lancashire and Cheshire Coal Owners' Association have adopted the improved Fleuss-Siebe-Gorman, and Messrs. Siebe, Gorman & Co., Ltd., of "Neptune" Works, London, are now engaged in manufacturing the necessary equipment for this station and surrounding collieries.

The Wood Drill Works, of Paterson, N.J., has issued a twelve page booklet entitled "Wood" Rock Drills, giving some valuable information and full description of the machines, showing their adaptability to tunnel driving, drilling in concrete, and open cut work; with detailed costs in driving the Tieton tunnel of the U. S. Reclamation Service at North Yakima, Wash., also on other engineering works, with a number of fine testimonials. The booklet is printed in three colors, and can be obtained from the A. R. Williams Machinery Co., Toronto.

Through the Allis-Chalmers-Bullock, Limited, Montreal, we have received Bulletin No. 1063, issued by the Allis-Chalmers Company. Gas engines and generators are the topics touched upon. After tracing briefly the advantages of the producer and gas engine, the distinctive features of Allis-Chalmers gas engines are outlined. The valve gear, ignition system, air starting device, and lubrication, are described. Engines from 300 to 5,000 h.p. are manufactured by the Allis-Chalmers people.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

The output of the Dominion Coal Company's collieries for January was about 200,000 tons, compared with 314,000 in January of last year. The output for February is expected to be about the same as that for January. The mines are now working about two-thirds time.

The Mabou Colliery, which for some time has been in the hands of the Government, pending an adjustment of the finances of the company, has been allowed to fill with water. A feeder has been coming in, presumably from the sea, and it has been found cheaper to allow the mine to fill than to attempt to keep it pumped out. Whenever conditions will permit of the operation of the mine there will be no difficulty in unwatering the workings and coping with the feeder.

#### Naked Lights vs. Safety Lamps.

We are glad to see that the Maritime Coal & Railway Company have put in safety lamps in their Chignecto Mines, since the burning accident previously referred to in these columns. We also understand the Inverness Coal & Railway Company are abandoning the use of naked lights. This is as it should be, and it may confidently be expected that before very long no naked lights of any description will be used in Nova Scotian coal mines.

In the United States the year 1908 achieved the ghastly record of the highest death rate in coal mines the world has ever seen. The present year bids fair to equal its predecessor. Hardly a day passes but the newspapers record a coal mine disaster. It may be that the disaster involves a mere half dozen men, or the death roll may extend to hundreds. The thing has become so common that one hardly notices the figure. We read it and think no more about it, and oftentimes it is difficult to know whether the account one is reading is that of a new explosion or the one that happened yesterday.

We read after these explosions that the mine was "reported safe," whatever that may mean; or vague hints are given of the possible connection between a seismic disturbance in Calabria, with an explosion in a naked light colliery in, say, Virginia, U.S.A. Is it not time to cease such cant and quasi-scientific blatherumskitel and put the blame for mine explosions where, in nine cases out of ten, it properly belongs, namely, to the account of naked lights and careless shot-firing.

We have in mind a case that came under our personal observation. A rent appeared in the pavement of a coal seam. The opening extended for a distance of forty feet, and emitted gas in such quantities that the intake air was fouled up to the fan-drift against an incoming air pressure of 200,000 cubic feet of air per minute. Safety lamps were used in this mine, and although some of the gauzes became red-hot and the men had to flee for their lives without their clothes, so rapidly did the gas come upon them, no explosion occurred, and nothing was injured. But what would have been the tale had naked lights been in use, or had one naked light been present? No one would have lived to tell it. Another case occurred in a seam that for years had been worked with naked lights. One day two men were working an electric coal-cutter alongside a fault. A pocket of gas must have been present in the vicinity of the fault, which the sparking of the motor ignited, and both men were killed. A gentleman recently giving evidence before the Royal Commission on Safety in England explained his antipathy to naked lights by relating that for 25 years his father had worked in a mine where naked lights were in use, but one day the mine exploded, and every person below, the witness's father included, lost his life.

In the "Colliery Guardian" for the 15th January this year is the account of an explosion that killed three men at Blaenavon, Wales. For four years the Inspector of Mines, Mr. Martin, had urged upon the management of this colliery the risk they were running in using naked lights. Even after this accident the manager said he was prepared to take the responsibility of working the mine with naked lights.

If an Inspector of Mines is to be of any benefit at all we think it should be in his discretion to prohibit the use of naked lights on his own judgment, without the necessity of resorting to the intervention of a Commission or of arbitration. Events are tending this way in England, and it may be fairly anticipated that one of the recommendations of the present Commission will be to give the Inspector power to enforce the introduction of safety lamps. We are a little ahead of England in this respect in Nova Scotia.

The figures collected by a previous English Commission proved that 80 per cent. of the explosions in mines were directly due to naked lights. Is it too much to say that if safety lamps had been made compulsory in all coal mines that the

enormous death roll attending these explosions would have been prevented, in part if not wholly?

### BRITISH COLUMBIA.

#### Rossland, B.C.

Mining throughout this whole district has received a setback from the extremely cold weather that prevailed in January; that has affected the ore shipments of the district to a very considerable extent for the first month of 1909. Owing to the slush and ice in the Kootenay River the West Kootenay Power & Light Co. was forced to stop its water wheels, with the result that the mines and smelters of Rossland and the Boundary were without the heavy voltage electric power that they depend upon the Bonnington Falls power plant to furnish for the lighting of the mines and to turn many of the wheels about the works. At the Trail smelter it was found necessary to draw the matte from the furnaces when the power was shut off, and one pot of matte exploded, setting fire to the building, which has caused a week or ten days further delay at that plant. At the works of the British Columbia Copper Co. having been forced to close down, the company took advantage of the moment to make some needed repairs, with the result that the amount of work lost at that mine has been much more than the few days of the shut-down of the power plant amounted to. The same condition, to some extent, prevailed all through the mining district for two or three weeks. There is always a lot of work that cannot be done without a shut-down, and the mine managers avoid shutting down unnecessarily, hence, when nature takes a hand and compels the mines to close many repairs are undertaken and a lot of clearing up work done that has been accumulating for some time. A coal shortage last week was the cause of about 80 men being laid off at the Le Roi mine. Many of these will be taken back as the coal supply gets better, and, it is hoped, that before very long the full force will be at work again.

The report of the Le Roi Mining Co. for the 15 months ending September 30th, 1908, is not exactly suited to bringing joy to the heart of a shareholder, although there are some redeeming features to it. The financial statement shows a debit to loss and gain account of £24,895 for the period. This figure is arrived at after writing off £27,108 2s. 4d. for exploration and development; £9,701 0s. 3d. on account of depreciation, and £3,994 17s. 5d. for sundry items, making a total deduction of £40,804 0s. 5d. The liabilities of the company are shown on the financial statement as £65,326 10s. 8d., while the assets appear as £95,792 6s. 6d., showing a surplus of £30,465 15s. 9d. This figure is very much lower than the surplus appeared for the year 1907, when it was £74,259 19s. 4d. The company, it appears, mined 100,444 "dry" tons of ore for the 15 months which it is said carried an average of .363 oz. gold, .55 oz. silver and 1.22 per cent. copper, from which it realized about \$11.11 per ton. The cost of mining and treating this product of the mine was \$11.71 per ton, which figure, when compared with the other, speaks for itself. This cost in 1907 was \$10.02, and in 1906 \$10.50; there were heavy fixed charges spread over the smaller tonnage shipped in 1908 than during the two previous years, however, and there is no way that these charges can be reduced to any extent under the present system. To the lay observer, who may not be acquainted with important facts bearing on the case, it looks as though the company ought to make a better showing; that is, it seems to one that the Le Roi mine produced enough good ore during the period named to have paid a good profit, and aside from the fact that they paid off a part of the bank overdraft, there is a showing on the wrong side of the book. If the Northport smelter, with its heavy fixed charges, is responsible for this loss, is there not some way that this asset (?) could be done away with and the concern placed on a paying basis? If this was done and a little more economy exercised in connection with the London office, then the Le Roi

mine ought to pay profits as easily as the other large producers on Red Mountain are doing. Might as well have a reconciliation now as any later date and make a new start, if such a course is necessary.

The operators of the I. X. L. shipped a 6 ton lot of ore to the smelter last week. The last lot of ore that the lessees of this mine shipped returned them over \$100 per ton, and it is expected that this 6 tons will average fully as much.

**Phoenix.**—The output of the Boundary mines has been somewhat curtailed during the past few weeks. During the week ending January 30, the Snowshoe and Oro Denoro again appeared on the shipping list, the total output of the district for that week being 32,301 tons, which is getting up near the standard output once more.

There are nearly 240 men employed in the Mother Lode mine at present. It takes a much larger force to get out the required amount of ore for the big smelters here during the winter months than in summer, when glory hole operations can be advantageously carried on. The reason is obvious; but the ore shipped from the underground workings is of a much higher grade than the product of the glory hole; for one reason there is a better chance to select ore for stoping, and ore sorting can be carried out on a better scale.

The mines of the Dominion Copper Co. are free from water, and everything is being kept in condition for a resumption of work when the order comes along, which manager P. F. Roosa says will very likely be some time during the coming six weeks. The machinery at the smelter is being fixed up so that there will be no delay at that end when shipments are begun.

The Granby Company is making an average of close to 2,000,000 lbs. copper per month, from which they should realize a net profit of \$65,000 to \$75,000, as it is understood they are making copper for a little over 10c per lb., when working at the normal capacity of the smelter.

Development on the Johannesburg claim, Greenwood, is giving most satisfactory results. It is anticipated that this big, low-grade deposit will contribute a considerable tonnage to the output of this district some day in the future.

The work of installing the new tram on the Golden Eagle mine has begun, and it is expected that the work will be finished and ore travelling over the tram in a couple of months.

For some weeks it has been rumored that Frank A. Ross has resigned from the Daly Reduction Company, Hedley, and that M. K. Rodgers, who formerly had charge, would again become associated with the Nickel Plate Mine. Mr. Ross now denies this, and states that the mine will be started up again as soon as water is available for the mill, and that the same management will be in charge of the work, as was the case last year.

The 450 ft. tunnel on the Woodburn has been completed, but it will be necessary to make another contract and drive this adit a still farther distance before the ore body will be encountered. The present showing in the face of the tunnel is satisfactory to a degree, the rock being well mineralized.

There is no doubt but the time is coming when dredging will be carried out on a goodly scale in the Similkameen. There is a large area of promising ground in the districts where placer mining was carried on in the early days, and where a dredging enterprise would pay handsome profits at the present time. Hydraulic mining has been tried along some of the streams in this section of the country, but various unfavorable conditions were against the profitable working of the ground gone over. A large force of Orientals still find it profitable to work much of this ground. The conditions in many places are suitable for dredging, as the gravel would not average over 30 ft. deep and the bedrock is not too hard, so that a good clean-up can be made. This Similkameen gravel will carry from 25c to 30c per yard on an average, and occasional rich pockets will be encountered. As is fairly well known, the dredging companies of other

districts are working gravel that only carries 15c per yard, it costing them in the vicinity of 8c per yard to do the work. As coal and other necessary supplies can be obtained at a reasonable price in the Similkameen, it will be seen that a good margin of profit should be realized on dredging in this locality.

The Greenwood prospecting tunnel scheme crops up from time to time, and it is now stated that a German syndicate has raised sufficient funds to begin work, and that operations will be started during the next few months.

**Nelson.**—The unwatering of the Silver King Mine is being rapidly carried on. A bailer is being used at present, but an electric pump will be placed at work in the mine to keep the water from accumulating when once it is all out. The force will be materially increased as soon as this is accomplished.

The bond on the Queen Victoria, the big low grade copper deposit, has been thrown up by F. A. Erlund and associates. A payment of \$15,000 became due a few days ago, and the syndicate gave up the bond rather than pay this amount, even though they had already expended nearly \$60,000 on the property. The claim has accordingly reverted to J. P. Swedberg, the original owner.

The Nugget Mine, Sheep Creek, has turned out four good bricks to date. The one shipped last week weighed 305 oz., and was worth \$5,000. The present production of the 4 stamp mill has been brought up to \$5,000 from \$1,500 by Manager J. L. Warner, since November last. It is the intention to increase the capacity of the mill to ten stamps.

On the Independence claim, of the Mother Lode group, they have cut the vein 133 ft. in from the portal; this at a depth of 86 ft. from the upper workings and 126 ft. from the surface outcropping. The ore at this point is similar to that found in the upper workings, which has returned the operators an average of \$2,450 per car of 30 tons.

The True Blue group of claims on True Blue Mountain have been bonded, and work is to commence. It is said that True Blue Mountain is a huge mass of low grade ore, and that the day is not far away when a heavy tonnage will be shipped from this locality.

At the Eleventh Annual Convention of the Associated Boards of Trade of Eastern British Columbia, held at Trail, B.C.,

Jan. 27-28, '09, the following resolutions affecting the mining industry were adopted:—

“Resolved, That the time of expiration of leases on mineral claims ceases at noon, instead of at midnight.”

“Gold and silver to be purchased in Canada for coinage purposes at the Canadian Mint.”

“In contemplation of the production of spelter in quantity by the zinc smelter now working at Nelson, that we represent to the Dominion Minister of Finance the necessity of a rearrangement of the duty upon zinc products coming into Canada, and to the Minister of Trade and Commerce the necessity of seeking, through the medium of Canadian trade channels, for possible markets abroad.”

**Vancouver.**—There is a movement afoot here to have a smelter built along the lines of the Nelson electrical zinc smelter, which could treat the zinc ores of the northern country, but more particularly of the district in the vicinity of South-eastern Alaska.

W. E. Young, of New York, has renewed options on a number of Kamloops mining properties. It is said that Mr. Young has the Newhouse and Guggenheim interests back of him, and that the plan they will try to put through is to acquire a large number of claims and then their holdings would warrant the building of a smelter at or near Kamloops. A reduction plant close at hand will be a necessity for the future success of Kamloops as a mining centre.

A lively interest is being taken in the smaller copper mines on the Coast, and several new ones have begun shipments to the Tyee smelter. The gradual rise in the price of copper seems to be the principal cause of this movement.

The output of the Cornell Mine, Texada Island, is to be shipped to the Tyee smelter. A test shipment recently sent to this plant returned the operators over \$20 per ton after paying all charges.

The company operating the Early Bird Mine, Moresby Island, recently sent 500 sacks of rich ore to the Tacoma smelter, from which they received over \$60 per ton. This old mine was worked by the Hudson's Bay Company in the early days, that company taking nearly \$80,000 worth of gold out of the workings, but owing to trouble they had with the hostile Indians of the locality, the mine had to be abandoned.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**Sydney.**—The Scotia Fire Brick Co., Ltd., has been formed to manufacture fire brick and fire-resisting goods from the deposits at Coxheath.

**Glace Bay.**—It is reported that the coal industry of Pictou County is in a very satisfactory condition, all the collieries of the Acadia Coal Co. are working full time. The Drummond Colliery at Westville is also working quite steadily.

There is a probability of work being resumed at the Broughton coal areas of the C. B. Coal, Iron & Railway Co. The areas will be worked either by the company that now owns them, which will be refinanced for the purpose, or they will be bought and worked by the C. P. R., which holds an option on the properties.

The sea entered the Mabou coal mines last week, completely flooding the mines. It is believed the sea broke in at a depth of 1,400 feet in a level unused for some considerable time. The property worked steadily till last October, since which time, on account of trouble with the syndicate, the Provincial Government has been in charge with about forty men at work,

under a Government inspector. It is thought that the mine can be pumped out.

### ONTARIO.

**Cobalt.**—An important strike has been made at the La Rose at the 200 ft. level. When starting a winze to raise up to the 110 ft. level, the main La Rose vein was encountered, showing eleven inches wide, and running over 4,000 ounces of silver to the ton. Up to this time no ore bodies had been thoroughly tested and blocked out below the 110 ft. level. This new strike proves values down 90 feet farther.

The Cobalt Central concentrator is now handling 100 tons per day. New machinery has recently been installed, and the plant now contains twelve tables, three jigs, two crushers and a conical pebble mill, besides smaller machinery. One hundred and twenty men are now employed on the property.

A vein two inches wide and carrying very rich ore has been discovered on the Townsite mine at the 90 ft. level.

The Silver Belt Telephone Company will have wires in operation from Smyth to Gowganda early in February. A modern

wire will be installed from Smyth to the main line of the T. & N. O. to make long-distance connection with Toronto.

The Temiskaming have their new twenty-drill compressor installed and ready to run. At the 200 and 250 ft. levels the ore bodies run from ten to forty-three inches in width, and they give an assay of five thousand ounces. Last year the Temiskaming produced over one million five hundred thousand ounces of silver at a total cost of six and a half cents per ounce. During the last three months of the past year over half a million ounces were mined and shipped at a cost of five and a half cents per ounce. This was done with a small plant working at the 250 ft. level.

The Coniagas Company has been successful in its action before the Chancellor against the town of Cobalt and one Jacobson. The defendants are owners of lots and streets, but the Coniagas Company hold the patent for mining rights there.

The Kerr Lake Majestic is being put in shape for active development, and a 12-drill compressor plant with engines, hoists, and other machinery is being installed. It is expected to be in full swing early in March.

The Beaver Mining Company have been fined \$200 and costs in the Cobalt Police Court for not having their shaft properly protected. The charge was laid by Mr. T. E. Corkill, Inspector of Mines, after the recent fatality at the mine.

The Hargrave Company have made an offer to the Kerr Lake Company to pay the latter a tonnage royalty on Hargrave ore mined and taken out through Kerr Lake workings. The Hargrave Company want to carry the Kerr Lake sixth level across the Hargrave line to break into Hargrave ore.

Negotiations of a similar nature are on between the Cobalt Lake and Cobalt Station Companies.

La Rose No. 3 vein (where the surface exposure of native silver was for a long time the show vein of the camp) is now being worked at the 120 ft. level. The vein in both drifts shows three inches wide, and carries 5,000 ounces of silver to the ton. The south cross-cut from the main shaft is in nearly 600 feet. When in 225 feet a native silver vein was cut and drifted on for 60 ft., showing a rich, narrow vein of native silver and argentite. The veins located last summer on the surface south of the office and carrying 2,000 ounces of silver to the ton will be reached any day now in this cross-cut and values demonstrated at depth.

One hundred and eight veins have been found on Nipissing. Three hundred and ten men are employed, and there are 20,000 ft. of underground development work.

**Gowganda.**—One thousand acres at north end of Gowganda Lake has been selected as a townsite by the Government. Surveying will start as soon as weather permits. The lots are to be sold by auction.

The plant has been purchased for a newspaper to be devoted to the interests of Gowganda.

**Fort William.**—The Northern Pyrites Company has sent out a trial shipment of six cars. Four cars have been sent to the Austin Mfg. Co., Harvey, Ill., and two cars to the Detroit Chemical Works, Detroit, Mich.

#### ALBERTA.

**Medicine Hat.**—The new natural gas well in the Medicine Hat field has now developed a flow of five million cubic feet per 24 hours. This is the greatest gusher in Canada.

**Lethbridge.**—The Canada West Coal Company, at Taber, has partially suspended operations. About 150 men have been laid off. The reason assigned for this action is shortage of orders for coal.

#### BRITISH COLUMBIA.

Greenwood, Jan. 25th.

The fourth general meeting of the Western Branch of the Canadian Mining Institute was held at Greenwood, January 25th and 26th. In the unavoidable absence of A. B. W. Hodges, chairman of the branch, the meeting was presided over by S. S. Fowler, Riondel.

Resolutions were passed, first, congratulating R. W. Brock on his appointment as director of the Geological Survey; second, endorsing the proposal to apply to the Dominion Government for monetary aid to the Nelson zinc smelter; third, expressing appreciation of the action of the Provincial Government in having assisted the same industry.

A suggestion was made that the Provincial Government be requested to subsidize the Branch, as it already does farmers' institutes.

Several interesting papers were read and discussed at the meeting. Afterwards the visitors were taken through the British Columbia Copper Company's smelter and the Mother Lode mine.

**Cranbrook.**—A company has been incorporated in Washington to work coal lands at McGillivray Creek. Arrangements are under way for the installation of the plant.

**Ymir.**—It is reported that the Canadian Girl and American Girl mines near here have been sold to a New York syndicate.

**Phoenix.**—The B. C. Copper Company took advantage of the forced shutdown recently, through lack of power, to make some necessary repairs to the smelter plant, thus obviating a shutdown later on.

Development work at the B. C. Copper Company's Lone Star mine has been suspended until spring.

The first carload of ore under the new management of the Republic mine has reached the Granby Smelter.

**Ingenika.**—The Ingenika-Findlay River Development Company have, according to the Vancouver World, between fifty and sixty claims on the Ingenika River and McConnell Creek. The company has an outfit, including boiler, sinking pump and geeral plant, now going in over the snow by dog teams.

**Vancouver.**—The discovery is reported of lode veins of platinum ore and gold-bearing fissure veins of quartz rock thirty miles south of Hope.

**Whitewater.**—The contract for driving 1,500 ft. of cross-cut for the Whitewater Deep Mine has been awarded to Frank Wilson and the Lade Bros. of Rossland.

**Vancouver.**—As the first step towards securing the largest fleet of gold dredges in operation in the North, a big dredge, costing \$70,000, was purchased in Vancouver for the Yukon Basin Gold Dredging Company. This company now controls 20,000 acres of rich dredging ground on the Stewart River.

**Victoria.**—The Pacific Tin Mining and Smelting Company, incorporated last month, intend erecting a smelter here to treat tin ores from Seward Peninsula, Alaska.

The new company has a working agreement with the owners of the Goodwin tin group, in the Seward Peninsula, Alaska, to take the whole of the output of the mine, which is proven to be one of the richest in Alaska. The Goodwin tin group is situated on Tin Mountain. This mountain contains almost the only workable tin in place so far discovered.

**Yukon.**—The first concentrator erected in the Yukon is at Conrad, Windy Arm. It is owned and operated by the Yukon District Gold Mining Co., Ltd., a Canadian corporation, with head offices at Toronto. It has been in operation since November 1st, 1908, has a capacity of 100 tons per day, and is supplied with ore from the Venus mine.

# MINING NEWS OF THE WORLD.

## GREAT BRITAIN.

An official table issued by the Home Office gives the number of fatal accidents in and about coal mines during 1908 as 1,136, as compared with 1,162 in the preceding year. The total number of deaths resulting was 1,306, as compared with 1,245 in 1907. The total number of deaths caused by accident in metalliferous mines was 37, an increase of 3, and fatalities in quarries numbered 92, as against 89 in 1907.

The wages of Northumberland coal miners have been reduced 3¼ per cent.

Owing to the scarcity of radium, a syndicate has been formed in London for working the pitch blende deposits in the Trenwith copper mine, Cornwall, with the hope of producing radium in commercial quantities. Previous to the discovery of radium the pitch blende was thrown away after the copper and uranium had been extracted.

## RUSSIA.

An extensive export trade in steel rails is being developed. The Societe Dnieproviennne Metallurgique du Midi de la Russie alone shipped 37,866 tons during the eight months ending with October last. Of these 14,016 tons were exported to Italy and 6,285 tons to Japan.

An Anglo-Japanese syndicate has been formed for the purpose of exploiting on a large scale the gold, silver and copper deposits of Manchuria on the right bank of the Yalu.

Rich silver-lead ores have been discovered in Murman in the far north of Russia near the Norwegian frontier. It is intended to develop the deposits, using electricity generated from water power for smelting the metals.

## GERMANY.

A new battery of 60 coke ovens is about to be established at the works of the Deutscher Kaiser Gewerkschaft at Ham-born.

## SWEDEN.

The total production of iron ore in Sweden in 1907 was 4,478,917 tons from 294 mines, a decrease of 23,000 tons as compared with 1906. The output of pig iron was 615,778 tons, an increase of 10,989 tons. The number of workmen employed at the iron mines and smelting plants was 9,970, a decrease of 525 as compared with 1906.

## AUSTRALASIA.

Tests of the Dawson coal of Queensland have proved very satisfactory, showing that it can be economically used in place of coke as fuel in suitable suction producer gas plants.

Upwards of 15,000 acres in the northern territory of Australia have been secured by different companies and syndicates for gold dredging. A dredging plant is to be sent to the territory in March and is to be operated on Sandy Creek. A lucrative alluvial gold industry was formerly carried on in some of these fields.

The labor dispute at Broken Hill, N.S.W., involving several thousand miners has been characterized by rioting and conflicts with the police. A number of unionists were arrested. The water main leading from the concentrating plant to the mill at one of the mines has been blown up.

Australian mining companies are contracting with the Cape Explosives Co. of South Africa, an offshoot of the De Beers Mining Company, for a supply of explosives by Australian manufacturers.

## SOUTH AFRICA.

Extensive floods which prevailed in January throughout the Transvaal and Northern Natal, caused considerable loss of life in the mining districts. The flooding of the Witwatersrand gold mine owing to the bursting of a dam resulted in the drowning of 160 mine employees, ten of whom were white men and the others natives.

Experienced prospectors who have returned from the new diamond diggings at Rietfontein in the Vryburg district report that the fields are not payable owing to the shallowness of the diamondiferous soil.

The attempt made by a Durban syndicate to work the deposits of molybdenum in the mountainous districts of Natal has been abandoned.

## INDIA.

It is announced that the Tata Iron & Steel Co., Bombay, will in the spring proceed with the erection of a new plant at a cost of £1,500,000, including blast furnaces, open hearth steel furnaces and rolling mills.

## CHINA.

The deposits of gold near the city of Laichowfu have been opened under the direction of the Chinese Government, and the enterprise has turned out successful though only antiquated methods of mining are employed.

Deposits of coal have been located by an American engineer in Shensi Province, and a Chinese-American syndicate has applied for a concession.

## UNITED STATES.

The suit brought by the farmers of Deer Lodge County, Montana, against the Anaconda Copper Mining & Smelting Co. to recover \$2,000,000 damages and secure an injunction to prevent the operation of the smelter on the ground that the fumes were injurious to vegetation, has been dismissed by the court. The hearing of the case lasted for one year and two months, and the judge took nearly two years to deliberate before giving his decision.

The convention of the United Mine Workers of America held at Indianapolis adjourned on February 6th after a three weeks' session. They demanded an 8-hour day for the miners in the Pennsylvania anthracite districts, increased pay, and full recognition of the union.

Seventeen miners were killed by an explosion in the No. 2 Short Creek mines of the Birmingham Coal & Iron Co., of Alabama, on February 2nd.

The Frick Coke Company has abandoned work on 1,700 additional coke ovens at Uniontown, Pa., and will substitute for them an enormous by-product coke plant at Gary, Ind.

Congress has been asked for an appropriation of \$2,500,000 for a fireproof building for the Geological Survey and other bureaus of the Department of the Interior.

## MEXICO.

Prospecting is being conducted with good results west of Laguna, a station on the Mexican Central Railway, in the northern part of Chihuahua. The ores are mainly gold and silver-bearing copper and lead sulphides.

A party of engineers under the direction of Pearson's Oil Field Department have left San Cristobal, Vera Cruz, on an expedition through the States of Chiapas and Tabasco for the purpose of making a geological and geographical survey of a region very little known.

The third furnace of the American Smelting & Refining Co. at Chihuahua has been blown in. The smelter is now treating 400 tons daily.

The Cananea district is resuming its former activity. Four of the Green-Cananea Copper Company's furnaces are in operation, and the other four will shortly be started.

## COMPANY NOTES.

### WATTS MINING CO.

The annual statement of the Watts Mining Company shows that mining expenses for the year were \$70,466.62, and general expenses \$18,497.14. Against this there were credited sales of ore amounting to \$131,582.62, from which had to be deducted for smelting and other charges \$14,204.98. The income account therefore shows that this mine only made \$18,244.40 for the year.

Another feature in the statement is that the Watts Mining Company at the end of the year, November 30, owed the King Edward Mining Company \$98,803.05, and other creditors \$11,107.76, a total of nearly \$110,000.

### NIPISSING EARNINGS.

President Earle says that during October, November and December, Nipissing earned a little over \$100,000 net each month. The indications are that January returns will be fully as good. This means at the rate of \$1,200,000 a year, which is equal to 20 per cent. on the \$6,000,000 stock.

The superintendent in charge of operations reports that a strike has been made on the Fourth of July shaft at a depth of 138 ft. There a vein running from one to two inches in width was found, the ore assaying as high as 2,000 ounces of silver to the ton.

A cheque for \$49,518.29 was received by the Provincial Treasurer on February 3rd from the O'Brien Mine, being the 29 per cent. royalty for the last three months of 1908.

The net profits for La Rose for seven months amounts to nearly \$650,000. This ore has come out of pure development work. Much of this work is in new territory and on new veins.

### LE ROI MINING CO.

On Friday, the 8th of January, the ninth ordinary meeting of the Le Roi Mining Co., Limited, was held in London, at which the reports of the directors; of W. A. Carlyle, M.E., consulting engineer; of A. J. McMillan, managing director, and of A. J. Larson, superintendent, were read and adopted.

The directors' report is for the 15 months ending September 30, 1908. The accounts show a balance to the debit of profit and loss £24,895 on the operations of the company for the period under review. The result is arrived at after writing off the sum of £40,804 0s. 5d, made up as follows: Exploration and development, £27,108 2s. 4d; depreciation of machinery and plant, surface improvements, etc., at the mine and smelter, £9,701 0s. 3d.; other items of expenditure, £3,994 17s. 10d. This makes a total of £40,804 0s. 5d. The liabilities of the company on September 30, 1908, amounted to £65,326 10s. 9d., and the liquid assets amounted to £95,792 6s. 6d., showing a surplus of liquid assets over liabilities of £30,465 15s. 9d.

The mineral property owned by the company forms a block of 142 acres in the centre of the Rossland mining belt, the larger part of which is virgin ground.

The report of W. A. Carlyle, M.E., consulting engineer, deals with the work done and the different veins and ledges. A definite plan for future development and prospecting of the mine was drawn up by Mr. Larson, superintendent, and himself. Mr. Carlyle praises Mr. T. Kiddie's work at the smelter, but says his costs would be materially reduced if a larger tonnage of ore was available for treatment.

A. J. McMillan, managing director, in his report stated that the severe decline in the market values of copper and silver had affected the mine greatly. Copper dropped from 22½¢ per lb. to 13¼¢ during the year, and silver from 68¢ per ounce to 51¼¢ per ounce.

The cost of mining, smelting and realization per ton in 1906, when 110,042 tons were mined, was \$10.50; in 1907, when 131,696 tons were mined, was \$10.02, and in 1907-8 (15 months), when 100,444 tons were mined, was \$11.71. During the year the ore values have increased \$1.40 per ton. The ore contained nearly 5 pounds more copper to the ton than in 1907, but owing to the fall in the price of that metal, the realization was less than during the previous year.

The ore smelted at Northport during the period ending September 30th, 1908, amounted to 124,263 dry tons. The matte shipped was 2,780 tons, valued at \$1,164,912.63, equal to \$418.97 per ton.

The report of A. G. Larson, superintendent, is substantially as follows:—

The tonnage extracted was made up as follows:—

|                                    |             |
|------------------------------------|-------------|
| Main vein .....                    | 30,093 tons |
| North vein .....                   | 4,498 "     |
| South and Intermediate veins ..... | 43,364 "    |
| Black Bear claim .....             | 22,489 "    |

Total . . . . . 100,444 tons

Main Vein.—The ore from this vein was of good shipping grade, and came chiefly from the 100, 350, 500, 700 and 800 ft. levels. Quite an important tonnage was found in parts practically abandoned some years ago. Development work is now under way on the 1,200 ft. level with a view to proving the downward continuation of this ore body.

North Vein.—The tonnage extracted from this vein is not as large as last year. The ore, though small in quantity, is of a good shipping grade.

South and Intermediate Veins.—The development work carried on resulted in opening up an immense amount of ore, a great deal of which was, however, too low grade to ship. At the present time development work is being done on what has every indication of being a large chute of ore, considerably above the average grade of the mine.

Black Bear Claim.—Payable ore bodies have not been found yet at a greater depth than 1,125 ft. Considerable work was done on the 1,200 ft. level, but the ore was scattered and too low grade to have commercial value.

Ore Production.—The ore mined and shipped during the year amounted to 100,444 tons, its metal values averaging: Gold, .363 oz.; silver, .55 oz.; and copper, 1.22 per cent. per ton, equal to an average value of \$11.11 per ton.

Development.—The details of development work during the year are as follows:—

|                                       | Footage. | Total cost   | Aver. cost Per ft. |
|---------------------------------------|----------|--------------|--------------------|
| Raising and winzing .....             | 485      | \$17,417.74  | \$35.91            |
| Cross-cutting and drifting ....       | 5,921.5  | 91,303.02    | 15.42              |
| Station and pocket cutting, etc. .... |          | 747.56       | .....              |
|                                       | 6,406.5  | \$109,468.32 |                    |
| Diamond drilling .....                | 5,224    | 14,305.17    | \$2.74             |
|                                       |          | \$123,773.49 |                    |

**NO CROW'S NEST DIVIDEND.**

Secretary Young of the Crow's Nest Coal Company has announced that no dividend will be paid to shareholders of the last half of 1908, in view of the heavy losses of the company in the Fernie fire, as well as the general depression.

**LE ROI NO. 2 COMPANY.**

The December report of Paul S. Counlley, mine manager, is as follows: Ore shipped, 2,410 tons. The smelter receipts were \$24,759, being payment for 1,995 tons shipped, and \$744 being payment for 73 tons concentrates shipped; in all, \$25,503.

## STATISTICS AND RETURNS.

**SMALL OUTPUT OF COAL.**

The output of the Dominion Coal collieries in January was 195,971 tons, for the same month last year it was 314,000 tons, illustrating the slackness of the present season. Last month was the smallest January output in several years, two years ago having been 45,000 tons more.

**SCOTIA STEEL OUTPUT.**

The Nova Scotia Steel and Coal Company's January output was 57,530 tons of coal, 5,730 tons pig iron, all steel products 6,498 tons.

**DOMINION STEEL.**

Dominion Steel's output for January was 21,100 tons pig iron and 22,073 tons of steel. The total shipments were 20,037 tons.

The rail mill, which has been idle for some time, will probably resume operations shortly.

**COBALT ORE SHIPMENTS.**

Following are the weekly shipments from Cobalt camp and those from Jan. 1, 1909, to date:—

|                               | Week ending<br>Jan. 23.<br>Ore in lbs. | Since<br>Jan. 1.<br>Ore in lbs. |
|-------------------------------|----------------------------------------|---------------------------------|
| Chambers-Ferland .....        | 62,000                                 | 142,000                         |
| Kerr Lake .....               | 62,460                                 | 123,460                         |
| King Edward .....             | 53,920                                 | 53,920                          |
| La Rose .....                 | 393,650                                | 924,100                         |
| Nova Scotia .....             | 41,390                                 | 401,390                         |
| Nipissing .....               | 186,033                                | 398,795                         |
| Peterson Lake .....           | 81,560                                 | 81,560                          |
| Right of Way .....            | 244,715                                | 244,715                         |
| Temiskaming .....             | 60,000                                 | 60,000                          |
| Temiskaming & Hudson Bay .... | 184,060                                | 264,060                         |

Ore shipments to date for 1909 are 3,124,745 lbs., or 1,562 tons.

The total shipments for week ending January 23 were 1,369,788 lbs., or 684 tons.

|                               | Week ending<br>Jan. 29<br>Ore in lbs. | Since<br>Jan. 1.<br>Ore in lbs. |

| Temiskaming & Hudson Bay .... | .....                                 | 324,060                         |
| Muggleby Con. ....            | .....                                 | 72,900                          |

Ore shipments to February 6, 1909 are 6,081,210 lbs., or 3,040 tons.

The total shipments for week ending February 6 were 1,441,397 lbs., or 720 tons.

**CROW'S NEST PASS COAL CO.**

The output of the Crow's Nest Pass collieries for the week ending January 22 was 15,033 tons, being a daily average of 2,505 tons.

For the week ending January 29th totalled 18,348 tons; daily average, 3,058 tons.

The output for the week ending February 5th was 16,979 tons, a daily average of 2,830 tons.

**B. C. ORE SHIPMENTS.**

The following are the ore shipments for the week ending Jan. 23rd and year to date in tons:

**Boundary Shipments.**

|                   |        |        |
|-------------------|--------|--------|
| Granby .....      | 14,421 | 45,074 |
| Mother Lode ..... | 9,744  | 22,134 |
| Snowshoe .....    | 820    | 6,336  |
| Other Mines ..... | .....  | 651    |
| Total .....       | 24,985 | 74,105 |

## Rossland Shipments.

|                            |       |       |
|----------------------------|-------|-------|
| Le Roi .....               | 634   | 2,216 |
| Le Roi No. 2 .....         | 810   | 1,392 |
| Le Roi No. 2, milled ..... | 206   | 620   |
| L. X. L. ....              | 8     | 8     |
| Other Mines .....          |       | 3,656 |
| Total .....                | 1,712 | 7,892 |

The total shipments for the past week were 30,242 tons and for the past year to date 91,039 tons.

## Granby Smelter Receipts.

## Grand Forks, B.C.

|              |        |        |

## MARKET REPORTS.

February 5—

Connellsville coke, f.o.b., ovens:—

Furnace coke, prompt, \$1.65 to \$1.75.

Foundry coke, prompt, \$1.85 to \$2.00.

## Metals.

February 5th—

Tin, Straits, 27.55 cents.

Copper, prime Lake, 13.75 to 14 cents.

Lake, arsenical brands, 13.50 to 14 cents.

Electrolytic copper, 13.50 cents.

Copper wire, 15.25 cents.

Lead, 4.10 cents.

Spelter, 5.07½ cents.

Sheet zinc, 7.50 cents.

Antimony, Cookson's, 8.05 cents.

Aluminium, 24 cents.

Nickel, 40 to 47 cents.

Platinum, \$22.50 to \$23.50 per ounce.

Bismuth, \$1.75 per pound.

Quicksilver, \$44.50 per 75-lb. flask.

The Robb Engineering Company, Limited, of Amherst, N.S., have recently received the following orders from Cobalt, Ont.: For the Crown Reserve Mining Co., one 30 h.p. Robb-Armstrong vertical engine; for the Colonial Mining Co., one 75 h.p. Robb-Armstrong vertical engine; for the Temiskaming Mining Co., two 100 h.p. Robb-Mumford water tube boilers.

# JUDICIAL SALE

## OF THE MINING PROPERTIES OF THE LARDER LAKE PROPRIETARY GOLD FIELDS, LIMITED.

Pursuant to the Winding Up Order made by the High Court of Justice in the matter of the Larder Lake Proprietary Gold Fields, Limited, and in the matter of the Winding Up Act, being Chapter 144 of the Revised Statutes of Canada, 1906, and Amending Acts, and dated the 23rd day of October, 1908, and with the approbation of George Kappel, Esquire, K.C., Official Referee, sealed tenders marked "TENDER FOR LARDER LAKE PROPERTY" will be received, addressed to "OSLER WADE, 64 WELLINGTON STREET WEST, TORONTO," Liquidator of the above named Company, up to four o'clock in the afternoon of Monday, the 8th day of March, 1909, for the purchase of the following assets of the said Company, consisting of thirty-seven mining claims, situated in the Townships of Gauthier, McVittie, and McGarry, in the Larder Lake Mining Division, District of Nipissing and Province of Ontario, and certain miner's supplies and other effects, all of which are set forth and described in the parcels hereinafter mentioned:—

### PARCEL 1.

Group of four claims around Bear Creek, in the Township of McGarry. The survey numbers and recorded numbers of the said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 79       | 1937             | L. M. 80       | 1936             |
| L. M. 81       | 1943             | L. M. 82       | 1945             |

There is a camp on L. M. 79, comprising: A bunk house, 18x20 ft.; cook house, 18x20 ft.; blacksmith shop, 12x14 ft., and a clearing of several acres. Bear Creek runs through L. M. 79, and according to a survey and an engineer's report, the creek can be utilized on L. M. 79 to develop power. Complete plans and profile of the survey and the engineer's report have been filed with the Department of Mines.

### PARCEL 2.

Group of fourteen claims near Larder Lake, in Township of McGarry. The survey numbers and recorded numbers of the said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 83       | 1965             | L. M. 84       | 1960             |
| C. E. 31       | 2132             | C. E. 34       | 1889             |
| C. E. 33       | 1883             | C. E. 36       | 1885             |
| C. E. 37       | 1887             | H. F. 35       | 2201             |
| H. F. 37       | 2018             | H. F. 38       | 1949             |
| H. F. 39       | 1961             | H. F. 195      | 1888             |
| H. F. 196      | 1884             | H. F. 197      | 1886             |

Claims L. M. 84 and H. F. 35 are subject to claim C. E. 62 so far as it overlaps. There is a well-equipped camp on said claims which consists of: One frame mill, 40x49 ft., with 18 ft. walls, and a battery of five stamps; engine house, frame, 20x30, equipped with 25 hp. engine and 35 hp. boiler, and an eject forcing pump, three-inch discharge, fully connected; storehouse, 14x20; cook house, 20x30; office, 20x30; bunk house, 1½ storeys high 20x28; stable, 15x22; blacksmith shop, equipped, 13x15; powder house, 12x18; a wharf, 16x35, and the goods and chattels of the Company, which consist of dynamite, tools, and other

**TITLE**—The claims contained in said parcels have a total acreage of approximately 1,300 acres, and have all been duly and properly recorded and surveyed and survey plans with field notes attached, filed with the Department of Mines. At least ninety days' assessment work has been performed upon each of the said claims. The remaining assessment work to be performed upon each of the said claims may be completed before August 1st, 1909.

An inventory of the goods and chattels of the Company and plans and photographs of the property may be seen on application to the undersigned.

**TERMS OF SALE**—Tenders are invited for the purchase of the five parcels "en bloc." Tenders may also be made for the parcels separately, and in case the whole property can be sold more satisfactorily in parcels, such tenders may be accepted. A marked cheque for ten per cent. of the tender, payable to the order of the Liquidator, Osler Wade, must accompany, as a deposit, the tender or tenders from each person. If a tender is accepted, twenty-five per cent. thereof must be paid within two weeks and the balance within three months from time of acceptance. The highest or any tender not necessarily accepted. The assessment work not performed to be completed by the purchaser, and the purchaser to take such title as the Company now has. The other terms and conditions of sale may be seen on application to the undersigned, and each tender shall be subject to those terms and conditions. The tenders will be opened by the Official Referee, George Kappel, Esquire, K.C., at his offices, Home Life Building, Toronto, on Tuesday, the 9th day of March, at 4 p.m.

For further information apply to the undersigned.

Dated this 26th day of January, 1909.

When answering Advertisements please mention THE CANADIAN MINING JOURNAL.

miners' supplies, all of which will be sold with the said claims. In the erection of the above-mentioned buildings the purchase of the machinery and plant and installation of same, and the purchase of said goods and chattels, there has been expended upon the said claims a large sum of money.

### PARCEL 3.

Group of nine claims, situated around Tournene and Bear Lakes, and close to Larder Lake. The survey numbers and recorded numbers are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| H. S. 101      | 2035             | H. S. 126      | 2028             |
| H. S. 102      | 2034             | H. S. 191      | 2031             |
| H. S. 104      | 2137             | L. M. 85       | 2217             |
| H. S. 123      | 2029             | L. M. 86       | 2218             |
| H. S. 124      | 2030             |                |                  |

### PARCEL 4.

Group of six claims, in the vicinity of Pancake Creek, close to Larder Lake, Township of McVittie. The survey numbers and recorded numbers of said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 50       | 2071             | L. M. 53       | 2486             |
| L. M. 51       | 2202             | L. M. 54       | 2072             |
| L. M. 52       | 2453             | L. M. 55       | 2203             |

### PARCEL 5.

Group of four claims, near Fork Lake, Township of Gauthier. The survey numbers and recorded numbers of said claims are respectively as follows:—

| Survey Number. | Recorded Number. | Survey Number. | Recorded Number. |
|----------------|------------------|----------------|------------------|
| L. M. 45       | 2378             | L. M. 47       | 2377             |
| L. M. 46       | 2389             | L. M. 48       | 2391             |

W. M. DOUGLAS,  
Solicitor for Liquidator,  
70 Home Life Building, Toronto.

# A Handy Reference List

We urge you to examine the books listed below with great care. Some are brand new—all are standard. We can supply any technical book in print

## Copper

### Principles of Copper Smelting

BY EDWARD D. PETERS.

*Professor of Metallurgy, Harvard University.*  
612 pages, 6x9; cloth, \$5.00 (21s.) postpaid.

### Modern Copper Smelting

BY EDWARD D. PETERS.

640 pages, 6x9; cloth, \$5.00 (21s.) postpaid.

### Copper Mines of the World

BY WALTER HARVEY WEED.

376 pages, 6x9; cloth, \$4.00 (17s.) postpaid.

### Notes on Lead and Copper Smelting and Copper Converting

BY HIRAM W. HIXON.

128 pages, 6x9. \$3.00 (12 6) postpaid.

### Pyrite Smelting

BY T. A. RICKARD.

*Formerly Editor of THE ENGINEERING AND MINING JOURNAL.*  
210 pages, 6x9. \$2.00 (8 6) postpaid.

### Matte Smelting

BY HERBERT LANG.

98 pages, 6x9. \$2.00 (8 6) postpaid.

## Lead and Zinc

### The Metallurgy of Lead

BY H. O. HOFMAN

*Professor of Metallurgy, Massachusetts Institute of Technology.*  
600 pages, 6x9. \$6.00 (26s.) postpaid.

BOOKS BY WALTER RENTON INGALLS.  
*Editor of THE ENGINEERING AND MINING JOURNAL.*

### Lead and Zinc in the United States

6x9; cloth. \$4.00 (17s.) postpaid.  
(Price subject to change)

### The Metallurgy of Zinc and Cadmium

701 pages, 6x9; cloth. \$6.00 (25s.) postpaid.

### Lead Smelting and Refining

336 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

### Production and Properties of Zinc

328 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

## The Manual of Fire Assaying.

BY CHAS. H. FULTON

176 pages, 6x9, illustrated. \$2.00 (8 6) postpaid.

Immediately upon its publication the leading assayers, metallurgists and professors of the country hailed this as the best work yet issued on the subject. It substitutes exact knowledge for the rule-of-thumb.

## Ore Dressing

BY ROBERT H. RICHARDS.

*Professor of Mining, Massachusetts Institute of Technology.*  
Two volumes. 6x9; cloth, 1250 pages. Profusely illustrated. Per set, \$10.00 (42s.) postpaid.

The standard authority on all classes of ore dressing by one of the leading mining authorities of the world.

Remember—We Sell All Books of All Publishers

# Canadian Mining Journal

313 Confederation Life Bldg.  
Toronto.

SOLE AGENTS FOR CANADA.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## THE ROAD TO GOWGANDA

BY THE  
CANADIAN NORTHERN ONTARIO ROUTE

is thirty miles shorter than any other. Beginning February 2nd, through sleepers leave Toronto, 5 p.m. arriving Sellwood (Moose Mountain Iron Mines) next morning. (Breakfast served on train.) From Sellwood to Gowganda is one day's sleigh ride over the company's own road; comfortable road houses are stationed at easy distances and a fast freight and passenger service has been inaugurated with all points in Canada. Inquiries invited:—

Wm. Phillips, General Freight & Passenger Agent,  
C. Price Green, Passenger Agent,

King and Toronto Streets,  
Toronto

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the  
**Mineral Territory** Open for Investment in the  
**Province of Quebec**

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining.

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants **PROSPECTING LICENSES** for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is \$5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only \$2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, \$10.00 per acre, and on lands situate less than 20 miles from such a railway, \$20.00 per acre.

Superficial products and building materials are sold \$2 and \$4 an acre according to the distance from rail road.

**MINING CONCESSIONS** are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed

lands; work must be bona fide begun within two years and \$500.00 spent for each 100 acre concession.

**MINING LICENSES**, giving the right to work the mine and dispose of its products, are granted on payment of a fee of \$10.00 and a rent of \$1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts.

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with **MR. MILTON L. HERSEY**, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

**The Hon. Minister of Colonization, Mines and Fisheries**  
**Parliament Buildings, Quebec.**

CLYDE PATENT WIRE ROPE WORKS  
Rutherglen, Glasgow, Scotland

## WIRE ROPES

For Winding and Haulage in Collieries and Mines, Aerial Ropeways, Transmission of Power, Suspension Bridges, etc. **SPECIALLY FLEXIBLE ROPES** for Hoists, Winches, Loading and Discharging Cranes, Shipping Purposes, Towing, Alligator and Dredger Ropes, etc. **SPECIAL ROPE FOR LOGGING.**

Our Ropes are made from wire drawn for our exclusive use, and are at work all over Canada. Messrs. Nova Scotia Steel & Coal Co., Ltd., who use them largely, write that one of our haulage ropes at their Wabana Mine has been in use for **5 years**, drawing over 1,750,000 tons and still in good condition. From the Atlantic to the Pacific they are well known and our agents will be only too pleased to give all information to enquirers. They may be had from the following, viz :

Nova Scotia: Wm. Stairs, Son & Morrow, Limited. New Brunswick: W. H. Thorne & Co., Limited.  
Montreal and Toronto: Drummond, McCall & Co. Vancouver, B.C.: John Burns. Winnipeg: David Philip, Portage Ave.

HIGHEST Quality. MODERATE Price. Prompt Delivery. SATISFACTION in use.  
Cables: "Ropery, Rutherglen." Codes: A. B. C. (4th and 5th Editions), A.I., Liebers and Private.

### SAVE HALF THE COST ON YOUR ASSAYS

How many samples have you sent to your assayer during the last year which showed no values? A test with Way's Pocket Smelter would cost you only five cents and could be made right in your office or in the field in less than five minutes. If your sample shows values, send it to an assayer, if not waste no more money on it.

We want you to know more about this Outfit which is saving money for so many prospectors, miners and mining men all over the world. An outfit which is guaranteed to give an accurate test on any ore of commercial value. An outfit of which one of our customers said, "is as far ahead of a pan as an electric car is ahead of a burro."

Send for illustrated folder today.

**WAYS POCKET SMELTER COMPANY**  
SOUTH PASADENA, CALIFORNIA

For the Assayer

### Superintendency Wanted

Mining Engineer desires position designing, erecting and operating a concentrating plant. Am experienced on the ores of the Cobalt District, and will submit recommendations from present and previous employers as to ability, reliability and working qualities. The superintendency of a mine would also be considered, or of both mine and concentrating plant.

Address all letters to

"SMELTER,"

Care of Canadian Mining Journal.

### Investors Attention

**FOR SALE:**—One of the best mining properties in North Cobalt. Assays show gold, silver and copper in abundance. Clear title to property. No encumbrance. For particulars address

BOX O, FREE PRESS,

DETROIT, MICHIGAN.

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

Or **WM. FLEET ROBERTSON**, Provincial Mineralogist, VICTORIA, B.C.

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

**Our Analyses Speak for Themselves.**

# OF CANADA

## Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

**W. W. CORY, Deputy of the Minister of the Interior**

## Montreal Steel Works, Limited

OFFICE AND WORKS :

St. Patrick St., Montreal

### MANUFACTURERS

of Steel Castings of all kinds, Springs, Frogs and Diamond Crossings

*We make a specialty of*

### Manganese Steel Castings

*for Mining purposes.*

AGENTS FOR

THOMAS FIRTH & SONS, Limited

"Speedicut" high speed steel, tool steel, axe steel, saw steel, files, etc. A large stock carried in our Montreal warehouse.

Also Agents for Barrow, Haematite Steel Company, of Barrow in Furness, England.

Steel Rails of all kinds, Fish Plates, etc.

## RAMPART CEMENT

Perfectly Sound. Never swells or bursts.

Reliable for all purposes for which hydraulic cement is used.

Fineness 92 per cent. through a 200 mesh sieve.

Strength up to standard specifications, and permanent.

Used by the leading Mining Companies of the Maritime Provinces.

### Sydney Cement Co., Ltd.

*Rampart Brand*

**SYDNEY, NOVA SCOTIA, CANADA**

## "FOREST, STREAM AND SEA-SHORE"

A book of over 200 pages, illustrated in colors and in half-tone, giving well-written description of the country contiguous to the line of railway, replete with historic incident, legend and folk-lore, worthy a place in any library. Send ten cents in stamps to

**General Passenger Department, Intercolonial Railway**  
**MONCTON, N.B.**

# Westinghouse Motors For Mine Work

## The operation of pumps with Westinghouse Motors

will in almost all cases, excepting in very large water works, show a far greater economy than with steam-driven units. The power delivered at the pump shaft by a Westinghouse motor is at the same economical rate as that of the highly efficient engines in the power house, less the small electrical losses

## Canadian Westinghouse Co., Limited

## SULLIVAN AIR COMPRESSORS

**Sullivan** small Air Compressors, of the straight line pattern, are built in capacities from 90 to 175 cubic feet of free air per minute, steam or belt driven.

They are carefully designed to secure compactness, light weight, without weakness and durability of the working parts.

These machines are particularly suitable for small or temporary plants. Their low weight makes transportation an easy matter.

Send for Catalog No. 658.

# The A. R. Williams Machinery Co., Limited

Head Office: TORONTO, Branches: MONTREAL, WINNIPEG, VANCOUVER.

Manufacturers, Importers, and Dealers in all kinds of Engines, Boilers, Machinery and Supplies.

# Straight-Line Power Driven Air Compressors

Centre-Crank Type, Mounted on Cast-Iron Base.

This compressor is a portable self-contained machine of simple construction and compact form, made in small and medium sizes. It is suitable for any conditions where moderate quantities of air are required and where power is available, as for pneumatic tool service in manufacturing and industrial plants, stone yards, in erecting bridges and structural work, for small air lifts and in electric power houses for blowing out generators.

Built in two styles, the small and medium sizes are of the centre-crank type with outside-hung driving wheels while the larger sizes are of the side crank type with a single wheel supported between the bearings. These machines are of strong and exceedingly simple construction and the material and workmanship are high grade. The strains being taken in direct lines make the machines well balanced and smooth running. They are easily set up or moved from one location to another, the air cylinder is water jacketed.

These machines are built for vacuum pumps, for vacuum cleaning systems and other purposes, and for all pressures from one to one hundred pounds per square inch.

# DRY CONCENTRATION

## Absolutely Dustless The Behrend System

The Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor.

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

Write us for descriptive pamphlet. Forward sample of your ore for preliminary test.

Canadian Behrend Dry Concentrator Co. Ltd.

OFFICE, Citizen Building, OTTAWA, ONT.

Test Plant, 48½ Inspector Street, Montreal, Canada.

## THE AMERICAN COAL INVASION.

The coal mine operators of Nova Scotia are facing a serious situation. The St. Lawrence market upon which the prosperity of the Province's collieries depends, is being systematically invaded by American coal producers.

The collieries of Nova Scotia furnish employment, directly and indirectly, to twenty-one thousand men. Last year (1908) the total production of coal exceeded six millions tons. Total shipments amounted to about five and one-quarter millions. Of this amount a large proportion, roughly two million tons, was shipped up the St. Lawrence to Quebec, Montreal, and intermediate points.

Against United States coal there is a Canadian duty of fifty-three cents per net ton. This, apparently, is insufficient to prevent the dumping of large quantities of American fuels into Eastern Canada. Neither does the advantageous position of Nova Scotian collieries, which are either on or within easy distance of tide-water, suffice to offset the cheaper cost of production in the United States. The collieries of the latter country have a domestic market that is fully developed. They can, therefore, afford to exploit Eastern Canada. They are in a position to make temporary sacrifices that would swamp Canadian competition. Even now their efforts are causing serious embarrassment.

The situation thus created requires immediate attention. Hasty restrictive legislation is not to be recommended. But there is unmistakeable need of action on the part of the Dominion and Provincial governments.

As pointed out by Mr. A. S. Barnstead, in our issue of February 1st, 1909, something can be done in the direction of lowering the cost of living in Nova Scotia. The Province is sadly in need of an agricultural population. Mr. Barnstead affirms that not five per cent. of the necessities of life is produced in the neighborhood of the mines, and this in spite of the fact that many of the collieries are surrounded by good farming and arable lands.

At a conference between the Government of Nova Scotia and the coal men of the Province, held on January 14th, the Government's representation promised that official aid would be given in any proper direction. It was pointed out, however, that the direction indicated above, namely, the reduction of the cost of living by means of the rehabilitation of the agricultural industry, was thought to be most desirable.

Without doubt a movement of this kind would help matters considerably. But concerted action on the part of Nova Scotian operators is the first requirement. If danger threatens all alike, then the time has

arrived for a strong alliance between the Maritime coal interests. This need not be a combine. Rather should it be an operators' association, organized for the purpose of improving mining practice and lowering costs of production. Immediate good would result from this, and we believe that it would have the effect of gaining public sympathy.

It is suspected, with seemingly good reason, that there is a definite connection between the American raid upon our Eastern coal markets and the efforts of the United Mine Workers' of America to control the workingmen of Nova Scotia. This may be the case. If it is so, then one reason more is added to reasons already known that go to prove that the influence of that body is not desirable. Canadian workingmen are surely able to take care of themselves. The establishment of U. M. W. control in Nova Scotia would be an industrial and political disaster.

A fortnight ago the whole case was laid before the Hon. Mr. Fielding. The Federal Government is, therefore, in possession of all the facts. We are hopeful that effective measures will soon be promulgated. But, whatever happens, no one can assist the Maritime coal operator more than he can himself.

#### MENDELEEFF—CHEMIST.

The great Russian chemist, Mendeléeff, applied his brilliant genius and his extraordinarily wide knowledge to the development of his country's natural resources. His volume entitled "The Principles of Chemistry," illustrate this statement. The elaborate footnotes that occupy more space than the original text are, mines of information drawn from all sources. Written during the years 1868-70, the work was first rendered into English in 1891. It has passed through many editions, and has had a profound effect upon scientific thought and work.

Mendeléeff was one of the earliest and certainly the most brilliant exponent of the law of the periodicity of the elements. But he refused to permit the enticing field of pure science to engross his entire attention. To the genius of the philosopher, he added the practical wisdom and foresight of the true chemist. Everywhere he saw opportunities for applying the results of his laboratory researches, and always he urged his fellow-countrymen to exploit Russia's natural wealth for themselves. His life, indeed, is one grand argument against "secrecy in the arts." Had he been a lesser man, he might easily have become the Rockefeller of Russia. He worked as a man should work, and his name will live.

Mendeléeff own words are pregnant with inspiration and high idealism. To the younger generation of writers he writes thus: "The time has come to turn aside from visionary contemplation, from platonic aspirations, and from classical verbosity, and to enter the regions of actual labor for the common weal, to prove

that the study of science is not only an excellent education for youth, but that it instils the virtues of industry and veracity, and creates solid national wealth, material and mental, which without it would be unattainable. Science, which deals with the infinite, is itself without bounds."

#### CANADA AND AMERICA.

Merely for literary effect that unrestful person, Mr. Stephen Leacock, whose clarion colloquialisms last year set the whole British Empire on edge, has seen fit, in the last number of the University Magazine, to delete the International boundary. Mr. Leacock smiles (not without tears) at the whole American system of education. And in the term "American" he is pleased to include everything pertaining to Canada.

The young man, Mr. Stephen Leacock, is an astute and humorous person. He is not without guile; nor is he deficient in what, during his period of foreign aberration, he would have been coarse enough to denominate "gall." But an incidental lack he does display. He rarely takes pains to collect a little information before he writes. He merely gathers—like storm-clouds—and breaks.

When Mr. Leacock deplores several things, including the unanimously low literary taste of all of us, he wails over the "standardization" of university methods and men, he forgets that the system that has produced Mr. Leacock, or that includes him as one of its cogs, cannot be incontinently damned. Hence, moreover, the horrible unfairness of sweeping us Canadians into the cesspool of Americanism! The leaven of Leacock is ours alone! The Boundary must remain!

#### THE AGAUNICO MINES DEVELOPMENT CO.

In the Toronto Police Court, on Feb. 22nd, the Agaunico Mines Development Co. was fined \$300 for non-compliance with the Ontario Companies Act. The fine was paid. The representation of the Crown, after conference with the defendant company's attorney, permitted the case to end there. Here, also, we would be glad to drop the matter. But, alas! the Agaunico Mines Development Co. is not what it seems.

Last December copies of a prospectus were distributed by agents of the Fiduciary Company, Tacoma Building, Chicago. The name of E. J. Rosenfeld appeared as president of this charitable institution.

On the cover of the prospectus is pasted a passable imitation of a representation of weathered silver-bearing smaltite that appeared originally on the front of the Canadian Mining Journal. The contents of the prospectus have little or no bearing upon the actual value of the mine, and there are several pages of absolute lies.

Before giving a few samples of these we may remark that any project that needs bolstering and padding by

such absurd prospectuses, carries its own warning to the public. The Agaunico people know that they cannot afford to tell the truth about their mine. They therefore proceed to tell something else.

The capital of the company is \$5,000,000, of which \$1,500,000 was used "for the acquisition of the property and financing of the company. The Temiskaming-Cobalt Mine, which is the property described in the prospectus, is thus offered to the public for \$5,000,000. The impression is conveyed throughout the prospectus that the Temiskaming-Cobalt is not only a silver mine, but a gold mine. It is, of course, neither. It has produced either a negligible quantity of silver or none at all. It has, we believe, large showings of smaltite and cobaltite, which minerals are extremely difficult to market.

A cheerful person, S. W. Gilbert, signs a report which is accompanied by the most remarkable map that it has ever been our fortune to see. Mr. Gilbert after declaring that "operations up to date have been carried on upon only two parallel veins," signs his name to a map that shows a "belt" of silver, one mile long and six feet wide, that he describes as "a reservoir of solid silver."

Belt No. 2, according to the same charming fictionist, consists of a belt of gold "one to two feet wide." The gold belt is also pictured luridly on the map.

Mr. Gilbert, if he is still at large, should receive attention from a commission of alienists. So also should the eminent business men of Chicago who ask anybody to swallow this bosh.

We have no time to squander upon the remainder of this pamphlet. Gilbert's report alone is enough to prove that the promoters of the Agaunico Mines Development Co. are either fools or knaves. We are exceedingly sorry to see that Mr. D. B. Rochester of the Cobalt Lake Mining Co. has permitted his name to be used by these gentlemen from Chicago. Mr. Rochester has been long enough in Cobalt to know that Gilbert's report is a pipe-dream or worse.

Mr. E. L. Fraleck, quoted by the Agaunico people as their consulting mining engineer, protested vigorously some time ago and is continuing to protest.

As a valediction we dismiss the subject with the remark that if the Agaunico Mines Development Co. published the truth about this Temagami-Cobalt Mine, and the truth is not far to seek, they would not sell one cent's worth of it to any person of sound mind.

### CONFLICTING FIXTURES.

Much to the regret of many mining men, the dates fixed for the annual meetings of the Mining Society of Nova Scotia and of the Canadian Mining Institute overlap. A number of the members of the Institute had expressed their intention of attending the meeting of the Society; but this has been rendered almost impossible as the

first day of the Halifax gathering coincides with the first day of the Montreal convention.

In future matters should be so arranged as to obviate this regrettable coincidence. Both meetings are pleasant and profitable events in the world of mining and larger numbers of both bodies should attend both.

### EDITORIAL NOTES.

At the first annual meeting of the American Institute of Chemical Engineers, held in Pittsburgh, on December 28 and 29, Dr. E. F. Northrup read an instructive paper on pyrometers. Among other points, Dr. Northrup alluded to the distinction that must be made between the sensitiveness and the accuracy of a pyrometer. All pyrometers should be calibrated in actual degrees, Fahrenheit or Centigrade. Resistance pyrometers are now so perfected that all temperatures from that of liquid air to 1200° C. may be indicated and observed accurately. But the instruments, to give good service, require the attention of trained specialists.

Mr. W. C. Ralston, a citizen of San Francisco, has been nominated for the office of vice-president of the American Institute of Mining Engineers. Mr. Ralston is a politician and a broker. The Mining and Scientific Press has raised its voice in protest against his nomination. Our contemporary contends, with perfect fairness, that, although the membership of the institute is heterogeneous, it is essentially what its name implies—a society of mining engineers. Hence its officers should be mining engineers.

### PERSONAL AND GENERAL.

Mr. J. W. Evans, M.E., lately of Cobalt, has opened an office in Room 42, Lawlor Building, corner King and Yonge Streets, Toronto. Mr. Evans was one of the pioneers of Cobalt, and has a thorough professional knowledge of the district. He is also familiar with the new districts of Miller Lake and Gowganda.

The American Grondal Kjellin Co. has installed a testing plant for the concentration of iron ores according to the Grondal system at Sheridan, Pennsylvania, where ores will be received and tested free of charge.

The Grondal processes have had such an eminent success in Europe, where at present more than thirty plants are in operation, that it is time they were better known and more thoroughly understood by the iron ore producers in this country.

Mr. R. L. Broadbent, of the Dominion Geological Survey, has gone to British Columbia to make a collection of the ores and minerals of that province for the forthcoming Yukon-Alaska-Pacific Exposition at Seattle, U.S.A. The mineral interests of British Columbia being so large, the Government will make a special effort to see that they are well represented. Mr. Broadbent has had a wide experience in collecting minerals for expositions. He was in charge of this branch of the work for the St. Louis, Dublin, Milan and other great expositions of the past few years.

## DEPTH OF ASBESTOS DEPOSITS.\*

By Fritz Cirkel, M.E., Montreal.

"Asbestos found at a depth of 400 feet." This is the latest important news from that famous asbestos district, the Eastern Townships of the Province of Quebec. This intelligence is significant from the fact that the deepest asbestos mines are only 200 feet, hence the question: Where was it found? When the Black Lake Chrome & Asbestos Company, near Black Lake, had finished deepening their shaft to 400 feet for the purpose of exploring their great chromic iron ore body, they ran in a drift through a deposit of chromite and serpentine, and finally landed in asbestos veins of from  $\frac{1}{4}$  to  $\frac{1}{2}$  inch thickness, of great silkiness and flexibility. This event at first sight would seem insignificant, were it not for the fact that the question of depth of these deposits is one of greatest economic importance.

Before entering into a discussion on the subject under consideration, I wish to state here that the question of the permanence and persistency of asbestos deposits is a delicate one. It forms a subject upon which hardly any geologist or engineer familiar with the existing conditions has ever ventured an opinion; yet from an economic point of view it is highly essential that the matter should be given close attention, since the future of that district, which furnishes almost solely the world's market with asbestos, depends a great deal more upon the depth of these deposits than on the opening of new mines; but if the writer ventures an opinion on this subject, based primarily on observations in the field, it is done more with a view to stimulate a discussion than to come forward with new and extravagant theories. Now, it seems strange to the miner who is familiar with any other kind of mining than the exploitation of asbestos deposits, that a district with a history of over 30 years has no record of any kind regarding the character of these deposits below a depth of 200 feet. As a matter of fact, there is no visible evidence in any asbestos mine of the extension of the deposits below a depth of 225 feet, and it seems also strange that this discovery should be made accidentally in a mine of another class. However, if we consider the methods employed in the exploitation of asbestos mines, and also the difficulty, or rather impossibility, of testing the ore bodies by diamond drilling on account of the fibrous nature of the rock and mineral, it is at once apparent that this lack of knowledge is due to causes arising solely out of the peculiar occurrence of the mineral.

To treat the subject under consideration from a practical standpoint, it will be necessary to consider the results so far obtained in the present depths, and see what kind of deductions, if any, can be made therefrom. In conjunction with this, reference must undoubtedly be made to the genesis and also to the structural geology of the deposits, as well as to the formations with which they are associated.

When a new asbestos company intends to start operations, the first questions always asked are: How much is there of the mineral available, what does it cost to get it out and to refine it, and what profit is there in it? These are the paramount questions of the day in all mining enterprises, and the more briefly and decisively these questions are answered the more intelligent they are to the general public and the more effective are the actual results. In almost any other class of mining the methods of exploitation are char-

acterized by the preparation for stoping or winning of the mineral through shafts and drifts. Diamond drilling is frequently resorted to in case more light is needed on the extent of the deposits, either in a lateral or vertical direction. All these means are employed in order to arrive at a satisfactory conclusion as to ore in sight before any large amounts of money are spent in expensive mining and milling plants. They enable the examining engineer to draw pretty safely his deductions.

But in asbestos mining the case is different. Here the extensive but mostly low grade ore bodies do not admit of underground working such as is generally employed in mines of other classes. In the opinion of the writer only the richer asbestos mines can follow the great example of underground mining, such as was inaugurated for the first time at Thetford by Mr. George Smith, the general manager of the Bell Asbestos Company.

As a general rule, a quarry is started on a promising spot, and this quarry is gradually widened and deepened as work progresses. Almost all the virgin properties have only surface outcrops to show, and in a few instances a pit, say 15 or 20 feet down, is all that is offered for the purpose of arriving at a valuation of this property or at a satisfactory estimate of ore in sight.

It will be asked here: Why not open up the property by shafts, sunk at different places of the ore body? An answer to this question is found in the following statement: The most irregular character of asbestos shoots, both laterally and vertically, does not admit of an intelligent exploration by deep shafts. For instance, if a shaft is started on what is considered an excellent surface showing, it may be expected that just under the surface one of these lean shoots is encountered accompanying rich deposits, and if it is found that by chance this lean shoot extends vertically for some distance, the conclusion to be drawn from these conditions would certainly be not favorable, whereas if this shaft had been sunk perhaps, say just 25 feet away, the results might have been just the opposite. A striking example of this is the shaft which was sunk by the Bell Asbestos Company twelve years ago to a depth of 137 feet in the westerly part of this property. The ground penetrated did not pay to work, and the deduction was made that that part of the property was of little value. How far this conclusion was off the mark is demonstrated now by the excellent showings exposed through the great underground workings, and that part which was originally condemned has proved to be, the writer ventures to say, by far the richest asbestos ground ever discovered in the district.

Now, what justifies then the talk of depth of these deposits if no exploitation work in shafts and drifts or through diamond drillings is done? It is only the experience in other asbestos mines that guides us in this instance, and, so far as the records show, comparatively few mistakes have been made; and it may here be stated that of all the mining enterprises in all classes and denominations, asbestos mining in the Eastern Townships has the lowest percentage records of failure.

\*Paper read before the March meeting, 1909, of the Canadian Mining Institute.

The experience in the Canadian asbestos mines teaches us:—

1. That the asbestos occurs as "vein" or "slip" fibre in pay shoots, setting through the serpentine in irregular fashion, alternating with lean ore or serpentine poor in asbestos.

2. That often rich pay shoots are encountered when approaching a granitic dike or near the contact with the schist formation.

3. That the quality of asbestos at a depth of 200 feet and, as has lately been found in the shaft of the Black Lake Chrome & Asbestos Company, at a depth of 400 feet, is the same, or nearly so, as found on the surface.

4. That wherever there is a large lateral extension of serpentine, and in the latter an asbestos pay shoot the lateral extension of which on the surface is more

take the form sometimes of permanent displacements, and may cut off towards depth an asbestos deposit which on the surface showed all the requisite qualities of a pay shoot.

In the serpentine belt which stretches—as the writer will show later in a new treatise on "Asbestos"—from Range 3, Broughton, with a few surface interruptions right through the Townships of Broughton and Thetford-Black Lake area, interesting studies can be made regarding the permanence of asbestos deposits; but as time does not permit me to go into all of them, a few remarks shall here be made.

At the "Quebec" mine the fibrous rock found on the surface in small shallow pits continued both laterally and vertically along the contact with the schist formation, and the rock is now mined in a quarry about 300 feet long, 125 feet wide and 65 feet deep. At the Broughton property the fibrous serpentine which ap-

than 100 feet in both directions, this pay shoot almost invariably, with occasional interruptions of lean serpentine, continues towards depth.

5. That exploration work in shafts alone without the running of large roomy drifts in connection with such shafts, is entirely misleading, and in the majority of cases does not materially add to the value of the property.

Now I must repeat here that the lateral extension of the serpentine as under No. 4 is an important factor in the continuity of the deposit, for the reason that small strips or lodes of serpentine are contaminated and interrupted in their continuity by traplike portions of the adjacent country rock, which are never expected to be present in an extensive development of serpentine (except granitic intrusion) like that of Thetford and Black Lake. As experience has shown, this interruption in the narrow serpentine lodes may

pears only in a few places on the surface was found to extend all along the contact, and the quarries are now down 85 feet. In both cases the fissured and fibrous condition as observed on the surface was found to continue at depth, and although there may perhaps be a change once in a while in the quantity of the vein fibre—like in the "Broughton"—this does not in any way influence the general conditions governing the occurrence towards depth in these places.

The great quarries of the "King Bros.," the "Bell," the "Johnson," the "Beaver," all at Thetford, and also the deep quarries of the "British-Canadian," show conclusively that towards depth no marked change in the quality or richness of the asbestos shoot is observed; indeed, at a depth of 200 feet they appear as continuous and as rich as ever, and taking in now the new discovery of asbestos in a depth of 400 feet in the shaft of the Black Lake Chrome & Asbestos Company, we

certainly have reason to believe that asbestos deposits have no shallow depth.

But, as I said in the beginning of this paper, there are other and, I believe, more important reasons than those mentioned above, namely, those observable after an intimate study of the geological conditions governing these occurrences.

It is now pretty well established that the serpentine of the Eastern Townships, the mother rock of chrysotile asbestos, is a secondary rock, that is to say that is is the alteration product of olivine—diorite—a rock which has its origin in the interior of the earth and broke at one time through the earth crust to the surface. It can be conclusively shown that in nearly all cases this anhydrous olivine rock was changed gradually into serpentine or a hydrous silicate of magnesia, and that subsequently through the action of certain agencies fissures were formed and filled with asbestos from solution which gave rise to the ultimate crystallization of the fibre.

For the purpose of a better conception of these physical and chemical changes and their bearing upon the persistency of the deposits it will be necessary to state briefly how all these changes in all probability were produced.

Sterry Hunt\* shows that the alteration of olivine into serpentine would result in an increase of volume amounting to over 30 per cent. Now, admitting that some of the silica or even of the material is lost in the process of hydration, there must be still a great expansion at some time of the process, and this expansion must at the same time mean increased pressure in the interior of the rock, since the surrounding formation undoubtedly did not allow of an easy expansion through increase in volume. It was thus impossible that fissures could have been formed at this stage of the process.

There seems to be no question that as soon as the process of alteration was finished, a readjustment in the rock masses took place, and this readjustment resulted in the formation of joints and slickensides such as we find them to-day in the mines, and not, as is generally supposed, in the formation of fissures. This theory is substantiated by the fact that in the mines at Thetford numerous places can be seen where these fissures (asbestos veins) cut right through joints and slickensides. The next question arises, then, how have these fissures been formed? Was it through shrinkage due to a loss in silica or due to shrinkage of the rock mass through cooling? Now, if these fissures were formed through the loss of silica, they would have been formed during the process of alteration, that is, before the joints and slickensides were formed, but that this would have been impossible is simply explained above.

The most rational explanation, and the one which seems to gain most support, is the formation of cracks caused through cooling and shrinkage of the rock masses similar to the formation of cracks through shrinkage of a gelatinous mass of iron carbonate, as in the so-called septarian nodules of clay iron stone, as suggested by Merrill. However, it is also probable that the intrusion of those granitic dikes so frequently met with in the serpentine masses has caused or facilitated to a great extent the formation of numerous fissures in the immediate proximity of these intrusions by rapid dehydration through the agency of heat. The fact that

very frequently an accumulation of asbestos veins can be noticed in approaching these intrusive dikes seems to substantiate this theory.

Now, it is obvious, from a geological point of view, that all these great radical changes which were perhaps brought about during long geological time intervals, took place not only on or near the surface, but also deep down in the bowels of the earth. It is impossible to imagine that the changes in the character of the rock, viz., the alteration into serpentine, the subsequent readjustment of the rock, the forming of fissures and the ultimate filling of the latter with a crystallization of the serpentine solution, should have been confined only to rock portions near the surface, hence we are justified in assuming that these radical changes must have affected the whole system, that is, they must have extended to great depth. We cannot at this stage of investigation conceive of any influence coming from the surface or being exerted near the latter which could have created such conditions.

There exists a great difference in the quality of serpentine and the fibre found in the Thetford and in the Broughton district, and much interest is being manifested at present in the question as to whether there is any relation between the two occurrences. Recent investigations have shown—and this is amply supported by the discoveries which have been made during the last year or two—that the Broughton serpentine belt, which occupies a straight narrow strip in Broughton Township and in the easterly part of Thetford, conformably deposited with the Cambrian schists, continues with few small interruptions into the great serpentine knoll around Thetford village, that further a gradual change can be noticed from the "slip fibre" quality as at Broughton into the vein fibre as found in the westerly part of Thetford.

This evidently goes to show that there exists a genetic relationship between the two occurrences, and it seems very probable indeed that the serpentine belt over its whole extent has its origin in one common source, but that at Broughton, where the "slip" asbestos fibre is produced, additional changes and readjustments have brought about the prevailing conditions. In order to make this clearer a first attempt has been made by the writer to tabulate the successive changes which the original rock in all probability underwent until its present state.

1. Intrusion of diorite-olivine through the earth crust from below.
2. Gradual alteration of the rock to serpentine through hydration, and perhaps loss of silica, increase in volume.
3. Slow readjustment of the rock masses, resulting in the formation of joints and slickensides.
4. Subsequent formation of fissures as receptacles of asbestos fibre, through shrinkage of the rock and also through injection of granitic dikes.
5. Infiltration of serpentinous solution from the sides of the wall through process of segregation and subsequent slow crystallization of chrysotile.
6. Second slow readjustment of the magnetic rock mass and formation of "slip" fibre.

The writer has gone more fully into the question of origin than was originally intended, but this was deemed necessary in order to follow step by step the alteration and successive changes of the original rock mass, and also to show that these most radical changes cannot have affected the serpentine near the surface alone, but also must have penetrated to greater depth.

The agencies which have brought about all these

\*Mineral Physiology and Physiography, p. 506.

changes must have been steadily at work for enormously long periods, and their cumulative effects are crystallized in what we possess now in the shape of economic asbestos deposits.

The actuating dynamic forces have been of such great drastic effect that no man, it may be said, has ever observed their equal, because the changes have been brought about so slowly or so deep down within the crust that no direct observation is possible, and

for this reason we can only infer the mode of procedure by examining closely the results. To what depth then these rock masses have been affected by all these changes to produce what is now known as asbestos rock must remain a matter of surmise, but, judging from the results which lie now before our eyes, I venture the opinion that these workable asbestos deposits extend to considerable depth, probably to several thousand feet.

## THE SILVER ISLET VEIN, LAKE SUPERIOR.

By Walter McDermott, Past President.

Paper read before the Institution of Mining and Metallurgy.

In presenting the following reprint of an old article on the Silver Islet Mine, the writer offers as excuse the fact that the occurrence of native silver associated with nickel and cobalt may prove of some interest in connection with the present experience of mining at Cobalt; also that the influence of graphite on the silver deposition, together with the existence of gas in the ancient rocks of Canada, may receive some explanation in the paper of Mr. Hixon on a "Theory of Volcanic Action and Ore Deposits." The very age of the article may be considered as some reduction of the fault of its reproduction in the face of the general rule of the Institution as to the acceptance only of original papers.

In explanation of certain portions of the article, and of the remarks as to the proper attitude of mind for mining men on theories of ore deposition it is advisable to mention that the paper was written particularly to oppose the views of an authority from Nevada who had denied the possibility of any connection between the graphite and the silver, challenged the production of any evidence to the contrary from any other mining country, and maintained that the proper direction to look for silver in future was in the slate country, not within or near the diorite.

As regards the character of the gas met with, the suggestion of its being carbonic oxide rather than the more obvious assumption of carburetted hydrogen, cannot be taken as settling the question; although it can be stated that the alternative was considered at the time.

From the private manner in which this property has been owned and worked very few details of the mine have been made public; although the vein, as developed, is in many respects remarkable and the conditions of occurrence of the silver are well worthy of attention. In the following paper it is proposed to give an account of some of the most striking features of the vein, with a comparison of the conditions determining the deposit of the silver with those in mines of other countries.

The position of the Silver Islet vein, on a small bare rock, 70 ft. by 80, three-quarters of a mile from shore and exposed to the full sweep of Lake Superior, has controlled the extent of the workings. It is not proposed here to describe the difficulties to be overcome in order to work a vein actually under water at its outcrop on a bare rock over which the waves of Lake Superior freely washed in every storm. Suffice it to say that at a great cost the matter was accomplished, an artificial island built up of cribs and thousand of tons of rock, a watertight coffer-dam sunk, and a shaft and customary workings opened.

This opening of the lode by a single shaft has limited the workings, so that although the mine has been in

active operation some six years the present depth is only about 650 ft., with a maximum extension of about 500 ft. From this small excavation, but really confined to a mere portion of it to be subsequently described, about \$2,500,000 in silver have been taken; and there is no reason why as much more may not be hereafter extracted.

The immediate country rock around Silver Islet consists of a very silicious slate, with a slight dip to the east. Through this slate a number of diorite dykes cut, running in a general north-easterly direction. These dykes, withstanding better than the slates the action of the air and water, are left standing in places as small islets or as a backbone to larger islands, in the vicinity of Silver Islet, which is itself one of the small crags of diorite left above water.

When work was first commenced on the rock, the white, clearly-marked vein could be distinctly seen under a few inches of water, cutting at right angles across the dark body of the diorite dyke, and thus having a north-west strike.

In the mass of the dyke a strong branch vein east of the main lode, and diverging to the east, could be also seen; and south of the junction of these two, a strong spur shot from the vein diverging to the west.

In addition to these two a number of smaller strings or leaders could be seen leaving the body of vein matter, but falling into it again at a greater or less distance. About 20 ft. to the south of the junction of the east and main veins, the diorite was found to be strongly impregnated with graphite, giving a black, coarsely granular, friable character to the whole rock so changed.

The walls of the vein when cutting this rock were smooth and well defined often exhibiting beautifully polished grooved surfaces, perfectly black and soiling the fingers when touched; occasionally small nodules of pretty pure plumbago occurred in the walls, some of these weighing several pounds.

The zone of this graphite impregnation extended south in the dyke for a length of about 100 ft., with an average width of about 40 ft., occupying the entire space between the east and the main lodes at this point, and extending in places a few feet outside of both.

The general form of the zone was an irregular pear shape, with the small end north, in correspondence with the approach of the two veins to each other. The mass of gangue itself consists of an irregular mixture of white and salmon coloured crystalline calcspar, carrying also carbonate of magnesia; and, in the colored portions at least quite a proportion of manganese, probably as rhodochrosite, indeed, distinct crystals of that mineral have been observed.

With the calespar, irregularly distributed, are patches of quartz and scattered crystals. As in most vein gangues the character varies, being in places highly crystalline and at other points finely granular, while the proportion and depth of color of the pink spar and the distribution of the quartz add to local differences, and after experience become accepted as indications either favorable or otherwise to the occurrence of silver.

The width of the vein varies, but will average from 5 to 6 ft., though at one point increasing to 25 ft., and at another pinching almost out.

At certain parts of the lode "vuggs" are frequently met with, usually lined with crystals of calespar, quartz, and often containing clay, with varying quantities of iron pyrites, galena, zinc-blende, and argentite. The silver occurs mostly native, in grains, threads, or massive, rarely crystallised; also as sulphide of silver massive, or in leaves and well-formed crystals.

Associated with the silver are found iron and copper pyrites, galena, zinc-blende, niccolite, smaltine, and occasionally stephanite and pyrargyrite have been observed.

The form of distribution of the silver is in patches and streaks from 1 in. up to 2 ft. in width and from a few inches in length up to 20 or 30 ft. These masses occur either irregularly scattered, or arranged in broken lines for a distance of 50 or 60 ft.

Many of the pockets consisted of almost massive silver, with so little intermixed rock that the mass flattened under the hammer, and would remain shattered but firmly clinging after a blast.

The fact most striking to one who examines the parts of the vein from which the most valuable ore has been extracted is the evident connection of the deposit of the silver with the region of graphite impregnation of the wall rock, and this point will be readily conceded on the following facts:—

The east vein was found in sinking to drop towards the main lode, and at about 300 ft. in depth a junction occurred.

The plumbago was found to decrease in width as the veins neared each other, and at length, at about 360 ft., it suddenly cut out on a floor, and when the graphite ceased the silver was found no more.

The east vein itself received the benefit of the graphite, and yielded much rich ore until it fell into the main vein. When branches or small strings of the vein occurred in the plumbaginous rock, silver was generally found in them, often as a sort of thin plate between the spar and the graphite walls, and outside of the veins the graphite rock itself frequently carried silver.

The west vein, lying under the footwall of the main vein, joins the latter as already stated, the plane of intersection dipping off more and more to the south as depth is attained, at the 420 ft. level the two veins running parallel for over 100 ft.

It has been in the vicinity of the junction of these two veins, and within the body of the plumbago ground, that the immensely rich bunches of silver have apparently congregated in the upper levels. The dyke itself dips to the south, and the run of silver dipping in the same direction has always remained within the diorite rock. North and south of the dyke in the slate, the vein has so far proved itself incapable of carrying silver.

A few scattered small patches of silver have been met with, but the quantity has been so small and the occurrence so seldom, that practically all past experience would pronounce the slate as unproductive. The same term, indeed, might almost equally well be applied to

those parts of the diorite which do not contain graphite; but the graphite has not been found in the slate at all.

The west vein in the upper levels yielded very rich ore while running in plumbaginous rock, but on being followed out into clean, diorite, ceased suddenly to produce. The vein is not devoid of metallic minerals, either in the slate or in the normal diorite.

Galena and zinc-blende are found plentifully scattered, but neither of these minerals carry more than forms a mere trace up to two or three oz. of silver to the ton when found outside of the plumbago ground. Within the silver bearing portions of the vein both the lead and zinc-blende are usually rich in silver, in some cases the latter metal appearing to be contained within the ore as small disseminated grains of native silver, while in other instances the silver appears to be in regular combinations as isomorphous sulphide.

This rule, however, is not by any means universal, for occasionally patches of galena or zinc-blende are found in close proximity to rich bunches of silver, and yet are almost devoid of the metal themselves. The other fact, viz., that outside of the plumbago ground the galena and zinc-blende are practically without silver has so far been without exception.

The observation of the well-defined limits of the graphite within the diorite naturally led to the supposition that the mass, being in the form of a detached deposit, further pockets within the dyke might be fairly expected in sinking. The occurrence of graphite in Cumberland as large pockets within the trap-rock lends additional force to this belief. The expectation has in a small degree been already realised.

At a depth of nearly 200 ft. below the upper mass a small isolated patch of plumbaginous diorite was found; and about 60 ft. again below this a hard pocket was met with. Neither of these last two was of any great size, the lower and larger being only about 9 ft. in length, but it is a remarkable fact that in both cases some small streaks of silver were met with, although in the ground between and above no trace of native silver had been observed.

While treating on the subject of the graphite, another occurrence apparently connected therewith may here be appropriately mentioned. At a depth of about 360 ft. it was found that many of the "vuggs" were filled with an inflammable gas. This gas, either opened upon in volume by the exposure of a large cavity or issuing under pressure from a fissure in company frequently with water, was found to burn freely, and from its negative qualities and the color of its flame, was set down as carbonic oxide.

In some cases, especially in the lower levels, the volume of gas contained under pressure was really startling, and jets of flame many feet in length were maintained for hours at a time.

In one case a flame was thrown 40 ft. along the top of a level from the sudden breaking into and the ignition of one of these pent-up reservoirs. Some men were seriously burnt in this instance, and after the flame had somewhat subsided it became possible to creep along the floor of the level and plug up the drill hole from which the jet was issuing in such manner as to leave only a small flame burning.

This regulated jet burned steadily for about six weeks before the supply of gas was exhausted. The origin of the gas has been attributed in some way to the carbon of the graphite ground, and is accepted as a further indication of the probability of large masses of plumbago below the present workings.

Whether the gas it at present forming, or has remained pent up for ages within the cavities of the rock cannot be stated with the present knowledge of its occurrence.

The only fact bearing on the question of origin so far observed is that at the part of the vein where the gas was first seen an evident decomposition of the vein matter was taking place, the rock being honeycombed, softened and generally changed in character, the change having been accompanied by a deposit of well-formed crystals of silver glance, galena and zinc-blende. This, however, was only observed at one or two points in the vein, and may merely indicate the present formation of geodes within the veins, without connection with the origin of the gas found filling these cavities.

The water percolating through the fissures of the vein appears to be clear, pure and free of acid elements, as indeed might be expected in passing through a calcareous gangue. No analysis has, however, been made of the water. In boring with the diamond drill at a depth of 300 ft. below the lowest working, gas and water were met with again.

In recapitulation of the conditions under which the precipitation of the silver seems to have taken place, it will be observed that the determination of the deposit is in accordance with most of the conditions accepted as generally favorable in other mining districts.

In some respects every mining region is a law only unto itself, but there are certain generally accepted principles that apply with more or less force to all. It would be extremely foolish for a person to go from one mining country to another and apply a local experience in the first strictly to the second without regard to actual observation in the latter.

An engineer of experience will always, in the first place, discover all he can of the actually observed facts, and if he can then make these facts chime in harmoniously with any theory of his own, he will feel confidence in directing his explorations accordingly. If there be a want of harmony between facts and theory, the practical man bases his operations on the former, and keeps the latter to himself until circumstances are more favorable.

The past experience at Silver Islet has been that the vein is only productive within the diorite dyke; that the limits of the productive portions of the vein within the dyke are determined by the region of plumbago impregnation, both in horizontal and vertical extension; and that the said productive portions of the vein are within what may be taken as the influence (if any) of the junction of an east and a west vein with the main lode.

In the following extracts from Van Cotta's treatise on ore deposits it will be seen that all the conditions named above are generally accepted as favorable to the deposit of ore; so that any explorations based on the acceptance of these conditions has not only the weight of former experience as a justification, but is in accordance with such generalization as men of science have so far deemed it proper to make.

Of course it does not necessarily follow that even should the same conditions be again encountered, immense deposits of silver will be met with; but the chances are so greatly in favor of such a result that the search for similar conditions is the only rational method of exploration for the future.

Van Cotta, p. 44.—"The union of branches into a single lode or the reverse, the splitting up of a lode into several branches, has been frequently assigned as the richness or poverty of the same. The fact is indisputable."

That the influence of the country rock is great, and the passing of a vein from one rock into another is attended with changes in the extent of ore deposition, and consequently that a junction of two different rocks is a favorable condition, we have the following remarks from Van Cotta:

Page 50.—"Around Freiberg the lodes in general, without distinction in regard to the character of the formation, have attained a development favorable to mining only within compact rocks in which feldspar or quartz hornblende, pyroxene, as also carbon (graphite, anthracite), or carbonate of lime, form an essential ingredient. Although to be sure the lodes are not always favorably developed in rocks conducive to a deposit of ore, and are frequently even barren of ores within them, still, when they do contain ores, it is only in these rocks; while on the other hand they are always barren and never contain ores in the unfavorable rocks."

Page 48.—"At Kaafjord, in Finland, the country rocks consist of diorite and arenaceous clay slate. In the first the lodes are very rich in copper, in the last they are contracted and unproductive."

Page 49.—"In South Carolina the country generally is itacolumit, tale and mica schists, and gneiss, with dykes of greenstone, phonolith, etc. Where a lode comes in contact with a dyke, intersects it, or is broken by it, a local enrichment has always taken place. This enrichment is often so considerable that many lodes have only been productive in such places."

Page 466.—"The copper deposits occur developed at the junction of the diorite and limestone, or diorite and garnet rock."

Page 418.—"In Cornwall, by the passage of veins from one rock into another, a change usually takes place in the amount of ore, in which the portion of lode at the junction is often the richest."

Page 46.—"Near Freiberg the veins are enclosed in mica schist, which contains an irregular layer of black graphitic schist. The veins have only been found productive in the black schist. In the common mica schist they are poor."

Page 265.—"We have a very fine example of a bed-like impregnation formed from a lode fissure, which principally follows but one rock, and that a coaly one, like that in which the quicksilver ores in Idria occur, and also similar to that of Braunsdorf, near Freiberg, which exerts such a favorable influence on the lodes traversing it."

Page 507.—"Quicksilver beds in bituminous shales of Idria and St. Anna in Austria, also at Vallalta near Agordo."

Page 400.—"At Almaden Quicksilver Mine, Spain, the immediate wallrock is usually a black carbonaceous slate, and quartzite with which hard and fine grained sandstones and slates alternate, but contain no ores."

In addition to the examples cited above as to the favorable effect of carbonaceous matter in the country rock, some instances from the neighborhood of Silver Islet itself may be here alluded to.

At the Duncan Silver Mine, native silver with zinc-blende, galena and iron pyrites, occur in a large calcespar vein. The country rocks are diorite and slate; parts of the latter are of a black carbonaceous character, and such parts have been observed to be favorable to the occurrence of silver.

At the old Thunder Bay Mine the same fact was observed, and on a sudden change in the country rock the vein was lost, either by a throw or actual cessation of the vein.

At the Jarvis Island Mine a strong calespar and barytes lode crosses the slates and cuts a diorite dyke. In parts of the dyke the walls showed plumbago, and in such portions the vein usually yielded rich patches of ore.

In the Pie Island vein, strings of quartz in black carbonaceous slate are rich in native silver. At the Singleton Mine a bituminous substance is reported as existing in the wall-rock.

As a summary of the examples selected from Van Cotta, the following further extracts may be given, as the generalization to be drawn:

Page 59.—“There are certain rocks which can, locally at least, be termed ore-carriers, while others are almost the reverse of this. The modifying influences of the country may be of themselves so slight that they escape observation; they may still, however, become perceptible through combination with other causes. For example, the effect of the junction of two lodes may of itself remain imperceptible, and even so the effect of a particular enclosing rock, but where they both meet—that is, where the line of junction of the former traverses the, also but slightly favorable, zone of rock—a very perceptible enrichment takes place.”

Page 53.—“We may consider it proved from all these examples that the nature of the country has exerted a certain influence on the contents of the lodes, and especially on the unequal amount of ore they contain; but the observations hitherto made can only be regarded as local, the results of which are not adapted to application, except in the localities where the observations were made. Local observations must be made concerning this influence before it can be rightly adopted as a foundation for mining operations.”

Enough has been said and quoted to prove, as clearly as such subjects admit of, that the conditions under which the silver occurs in the Silver Islet vein are not by any means abnormal, and that therefore mining operations may be safely based on past experiences, and that any other plan of exploration would be without either practical or theoretical justification.

There are several points of interest which may be given in a description of a Silver Islet vein, and a brief enumeration of a few is here added.

Although the vein is only under water the mine is not what would be called very “wet.” The water comes nearly wholly from below, streams of water in the upper levels ceasing suddenly when similar streams are cut at a lower point; the water may therefore be called legitimate mine water.

The fact has often been observed both north and south of the diorite dyke that a “throw” of the latter along the line of the vein has taken place, the diorite being found on one wall after the other has changed to slate. This “throw” was either contemporaneous with the formation of the vein fissure, or at least previous to the filling in of vein matter, as no evidence of such an extensive movement is to be seen in the vein itself; the only indication of motion afforded by “slickensides” would point rather to a vertical than horizontal movement.

In the body of the vein “floors” of varying lengths are met with and occupy a more or less horizontal position, but not in such regular form as to set down to motion of the lode.

These “floors” are merely lines of division or cleavage planes, showing no difference in the vein matter above and below, and are always of a rusty color, due doubtless to clay and the passage of water; clay, as already stated, being found in many of the “vuggs.”

Along these “floors” thin leaves and small masses of sulphides of silver almost invariably occur.

There are two very interesting forms in which silver has occasionally been found. The first form is that of thin plates of nearly solid metal. These plates were from 1-16 to 1-4 in. in thickness, and some were 8 and 10 in. square. When cut with a knife a solid surface is exhibited and yet the plates are brittle.

The cause of the brittleness becomes apparent under a glass, when it is seen that the plates are formed by the aggregation of numberless minute grains of silver, connected in a manner, but yet distinct, and so closely deposited that the cut of a knife left to the eye an apparently homogeneous surface of metal. An assay of a portion of one of these plates showed it to be 980 fine silver.

The second noticeable occurrence is the distribution of minute grains of metallic silver through a body of clear crystallized calespar, giving the later an opaque yellowish color which on a grindstone speedily shows a bright metallic surface. Such ore is termed “clay ore” by the miners, owing to its colour, and might be easily passed by as valueless by an inexperienced person.

Some of the common forms in which the silver is found are extremely interesting, the native silver, in company often with niccolite, forming most beautiful arborescent figures through the body of the vein matter.

In the neighbourhood of “vuggs,” masses of curiously twisted threads of native silver, superficially coated with black sulphide, were frequently brought to light. A few well-defined but imperfect crystals of native silver have been observed.

At the surface of the vein, and partly exposed under water, a rounded granite boulder was found firmly embedded in the vein matter; the nearest granite in place is nearly 20 miles north on the mainland.

As a somewhat similar occurrence to the plumbago in the diorite may be given the finding of isolated and frequently large masses of a soft greenish chloritic substance. The principal mass of this dipped to the south across the dyke, and wherever it encountered the vein had a bad influence on the latter, breaking it up, pinching it, or simply impoverishing.

Work is now being pushed downwards in the diorite dyke and the vein is found strong, perfectly defined and of good character, not only at the present bottom but at the lowest point yet reached by the diamond drill. When it is considered that only nine levels have yet been sunk and that six out of those nine yielded remarkably in silver, it will be understood that the owners have good ground for expecting another prize, and for continuing work on the plan already so successful. And, in this connection, it is worthy of note that, the mine being well equipped and having all means at hand for working, including a fine stamp mill, will yield on all future discoveries an even greater profit than the operations have heretofore.

The Smart-Turner Machine Company, Ltd., of Hamilton are receiving orders for their duplex pumps from all parts of Canada. Among recent orders is one for an electrically driven rotary feed pump and receiver for the heating system of the Technical School, Hamilton. Another order is from the corporation of Medicine Hat, Alta., for two double suction centrifugal pumps.

## THE NEW TRAIL TO GOWGANDA.

In our last issue we promised more detailed information concerning the new trail to Gowganda. For the benefit of those who intend to send parties into Northern Ontario the following facts have been collected.

A Canadian Northern express leaves the Union Station, Toronto, at 5.15 p.m. daily. The train includes sleepers and dining car. Travellers arrive at Sellwood at 7.45 o'clock on the following morning. At 8 a.m. the stages leave Sellwood. Burwash stopping-place is reached at mid-day. At Phoenix, 20 miles beyond Burwash, the night is spent. Here there is accommodation for 50 men. The sleeping-room is clean and comfortable. Separate beds are provided.

### Gowganda Transport Company.

Rates on boilers, heavy machinery and other heavy articles from Sellwood to Gowganda, not exceeding 5 feet in width or height:—

|                       | Total charge. | Number of teams supplied. | Number of men supplied. |
|-----------------------|---------------|---------------------------|-------------------------|
| 1 ton .....           | \$40 00       | 1                         | 1                       |
| Over 1 to 2 tons..... | 120 00        | 2                         | 2                       |

BURWASH.

Shortly after noon on the second day Gowganda is reached.

A short cut through the territory of the Bartlett mines has lessened the drive from South Gowganda (Elkhorn) to Gowganda City by five or six miles.

The railway fare from Toronto to Sellwood is \$8.50, single. The sleeper costs \$2. From Sellwood to Gowganda City the stage fare is \$7, not including meals. Fifty cents per meal and fifty cents for a night's lodging are the established rates.

Mr. W. Phillips, the General Eastern Agent of the Canadian Northern Railway, Toronto, has kindly furnished us with the following provisional tariff issued by the Gowganda Transport Company:

If extra men are required to handle these articles from cars or to go along with the shipment to assist in handling, the extra charge per man will be \$2.50 per day. If owners have their own men available for this purpose, extra expenses will be avoided.

Should owners desire to handle these shipments themselves from Sellwood, the Gowganda Transport Company will provide teams at the rate of \$8 per team per day, which includes one man per team, as well as feed for horses.

Articles weighing over 4 tons are to be handled by owners only, the Gowganda Transport Company to provide teams under conditions outlined above.

These heavy shipments are to be handled over sleigh

road, so that no delay will occur in the movement of other sleighs containing freight or passengers.

It is important to note that although the snow may last until well on in April, yet it will be well for those who intend to ship in supplies to get them in at as early a date as possible. Ample storage facilities will be provided for merchandise, canoes, etc., at South Gowganda.

Meanwhile the road is to be kept in as good condi-

tion as possible; 150 teams are in commission. A road superintendent inspects the trail daily, and no pains will be spared to bring it up to its highest capacity.

The accompanying photographs will give a fair idea of the trail, etc. We would draw particular attention to the picture that shows a "valuable discovery." Ontario inspectors will have a busy time in the coming spring.

## THE REPORT OF THE GERMAN DEVELOPMENT COMPANY, LIMITED.

III.

1908.

### Abstract of Report on the Kananaskis Coal Area. By D. B. Dowling.

The matter in Mr. Dowling's description of the part of this area leased by the German Development Company is compiled from reports made by him to the Geological Survey of Canada, and papers read before the Canadian Mining Institute.

The prospecting of this area was not difficult owing to the fact that the exposures are mostly all on the hill-sides, in the gullies that run across the measures, the lower portion only being hard to expose owing to the greater accumulation of loose material from the higher slopes.

The few analyses so far made of outcrop samples show that these coals can be classed along with the Canmore coals, which are of great value as steam producers. Some of these seams may prove harder away from the outcrop or in the vicinity of the fault, but none of them should go higher than semi-anthracite in grade, except in local portions only of the seams. If a few seams do run to anthracite the market is not oversupplied and is steadily growing.

The major portion of this coal will serve for steaming (locomotive), and should be superior to anthracite for gas producer use.

Using the ratio between the volatile and fixed carbon constituents as a standard for comparison, the analyses of eight samples of the seams show that three of them are softer, or higher in volatile combustible matter, than any of the Canmore coals. Of the remainder all compare favorably with the upper or softer seams at Canmore. These Canmore coals have been in steady use on the C. P. R. locomotives in the mountains. This result is gratifying since the Canmore mines, capable of producing only 600 tons per day, was thought to be the only one in the district that could supply steam coal. If the measures near the Kananaskis be mined, the long haul from the mines on the Crow's Nest branch of the C. P. R. will be saved, and this area will become a large producer.

The number of seams discovered, as well as the undisturbed position of the measures, assure a very large total of mineable coal. Assuming that there is an average of 90 feet of coal to be mined where the whole thickness of measures is present, this amounts to 150,000 tons to the acre, or 90 millions per square mile. Allowing for dirty seams and coal left in the mine, an approximation of 65 million tons per square mile should not be excessive, or, for the total area of the company, about 500 million tons.

The Kananaskis Valley is wide where the measures cross it, and there is ample room and an excellent site for a town. The measures are cut to near the level of this valley by a small stream (Ribbon Creek), which comes from north of Mount Kidd, so that there are four points from which mining may start. The principal block of coal is north of the stream. The site there for mine works is ideal, as there is a natural terrace from which to drive tunnels, and from which loading facilities may be provided for the cars which would be below this level. This area being above the level of the river can be mined from the level entry, as in the plan pursued at Bankhead mine, affording natural drainage and very easy haulage for mine cars.

If the coal proves to be of the Canmore class the mining should be done as cheaply as at the above mine. The output will nearly all be marketed, as the fine coal is preferred by railway firemen. There will be a tendency by miners to include dirt with the run of mine, and careful picking and mining will have to be insisted upon.

In view of the fact that production of coal follows closely the increase in population, and in considering the future needs of the country, it is quite evident that if the present mines are working near full capacity, others must be opened in the near future.

The first need of the population is for domestic fuel. The next is for shipment of produce to market, and this means increased consumption of coal by the railways. Following the settlement is always the building of towns and the establishment of factories, mills, and other power users, so that not only the domestic fuel, but that for steaming and other power producing consumers, is rapidly called for.

Since the Kananaskis Valley coal grades from about bituminous to nearly anthracite, there should be a ready market for it, for both domestic and steam purposes.

1908.

### Abstract of Report on the Kananaskis Coal Lands. By James McEvoy, B.A.Sc. (Late Geologist and Chief Engineer to the Crow's Nest Pass Coal Co., Ltd.).

The Kananaskis coal lands, controlled by the German Development Co., Ltd., are situated on the Kananaskis River. The northern end of the property is 6 miles in a straight line due south of Gap Siding on the main-line of the C.P.R. The property is about 8 miles long, north and south, and its greatest width east and west is 2 miles. It comprises an area of  $7\frac{7}{8}$  square miles, or 5,040 acres.

A branch railway to reach the most suitable point of

access on the property would be 15 miles in length, and would connect with the C. P. R. at the Kananaskis bridge, a point distant 52 miles west of Calgary.

The Cretaceous rocks in which the Kananaskis coal occurs were deposited long before the Rocky Mountains were uplifted. When the uplift began the Cretaceous rocks were hardened and in a good state of preservation.

In that portion of the Kananaskis basin, in which the German Development Company's lands are situated, a great thickness of Cretaceous rocks was lifted up bodily.

The coal was evidently laid down in the form of peat bogs. Conditions generally may have been more favorable for the deposition of these bogs in Cretaceous times; in any case the bogs were of dimensions both in depth and extent, vastly greater than any bogs to be seen in Canada at the present time. Successive periods of inundation and covering up with mud and sand, with periods of quiet to allow the growths of other bogs, have laid down the series in the order that is now found.

The continued subsequent depression of the land brought about an enormous deposition of material

Estimating that only 75 per cent. of the coal can be actually taken out, we have:

$$519,750,000 \times .75$$

=389,812,500 tons, which can be actually mined, or 4,000 tons a day for over 320 years.

About 125 million tons of this amount can be mined "to the rise," that is, it lies above the level of the point of access, and can be lowered to the main haulage road by gravity, and it will consequently be produced at less cost.

The coal is found at the bottom of the Kootanie series, which is the lowest division of the Cretaceous. Overlying is the Dakota Group, also Cretaceous, and underlying are the Fernie shales of Jurassic age.

The coal is semi-bituminous, that is, of higher grade than ordinary bituminous. The variation in qualities as seen by the relationship between the percentage of volatile matter and fixed carbon shows a considerable range. Those coals low in volatile matter, other things being equal, are the best for domestic use; while those higher in volatile will be preferred for locomotive use. The percentage of volatile matter even in the samples lowest in that respect is large enough to show that the coal will be free burning.

A RELIEF MODEL OF THE KANANASKIS COAL AREAS OF THE GERMAN DEVELOPMENT COMPANY.

forming the strata on top of the coal series, and the weight of these overlying measures began the work of altering the peat into a lignite. The completion of the alteration into the present high-grade coal is due to pressure and heat induced by the mountain-building forces exerted along the Rocky Mountain range. The Cretaceous rocks of the Kananaskis basin are a continuation of those which outcrop at Canmore on the C. P. R., where there is an operating coal mine.

In estimating the quantity of coal so as to keep within safe bounds, let it be assumed that of the 5,040 acres in the property only 4,500 acres will be underlain by all the seams. Taking 70 feet as the thickness of workable coal we have:

$$4,500 \times 70 \times 1,500 \text{ (tons per foot acre).}$$

$$=472,500,000 \text{ tons.}$$

This should be increased by 10 per cent., on account of the extra width of the seams, owing to the angle of dip, therefore,

$$472,500,000$$

$$47,250,000$$

$$519,750,000 \text{ tons.}$$

There are two possible points of access to the coal for operating purposes, one near the west bank of the Kananaskis, near the south end of the property, and the other on Ribbon Creek, near the centre.

All things considered, it is most advisable to open the mines on Ribbon Creek. About a mile and a quarter up the stream there is a flat piece of ground abundantly large for a colliery yard and plant. The coal seams outcrop in the hillside adjoining this flat, and the situation is such that the working part of the tippie can be placed close up to the mine mouth, thus avoiding a long expensive tippie approach.

In the larger seams it will not be practicable to use the longwall system, and some modification of the pillar and stall system must be used. Whether the rooms should be driven up the pitch, or across the pitch, will depend upon the cleavage in the coal. If there is no pronounced cleavage, or if the cleavage is not more than "half on" when driving across the pitch, then that method is preferable. Working in this manner across the pitch the mine should be laid out in panels with a back-balance incline at one side. The length of the rooms on had best be about 300 feet in any case, but the length to which the incline should be driven up

must to some extent be governed by the angle of pitch. Beyond that length, especially if the coal is mining freely, one balance could not properly take care of the output.

The ventilation fan should have an ultimate capacity of 200 to 300 thousand cubic feet of air per minute, and should be constructed entirely of iron or steel, so as to be absolutely fireproof. It may be driven either by steam, compressed air, or electricity.

The output for a year or more can be taken out by horse haulage. After that time some system for handling the coal will be necessary. Next to the endless rope the compressed air locomotive is the best, and if, as is very likely to be the case, the former should be impracticable, the latter system should be installed.

1908.

**Abstract of Report on Bighorn and Brazeau Coal Lands.** By James McEvoy, B.A. Sc. (Late Geologist and Chief Engineer to the Crow's Nest Pass Coal Co., Ltd.).

The Cretaceous coal measures outcrop on the west side of the Bighorn range close to its base and it is on these measures that the properties of the German Development Co., Ltd., are located, one on the Bighorn River, where it runs around the south end of the range, and the other on the south Brazeau River, where the stream cuts a deep gap through the north end of the range itself. The same series of rock formations is met with in the Bighorn and Brazeau countries as was found in the Kananaskis.

#### Bighorn.

There are seven seams of workable thickness, giving a total of 46 feet 2 inches of coal. Six of the seams, containing 38 feet of coal altogether, do not extend through the whole of the area, and in estimating the quantity of coal available it is considered that only 1,500 acres underlain by these seams can be worked from the point of access on the Bighorn River.

Therefore,  $1,500 \times 38 \times 1,500$  (tons per foot acre).

=85,500,000 tons.

One seam extends throughout the area, but it will be assumed that only  $3\frac{1}{2}$  square miles, or 2,240 acres of it can be conveniently worked.

Therefore,

$2,240 \times 8 \times 1,500$

=26,880,000 tons.

Total, 85,500,000

26,880,000

+10% for dip, 12,238,000

124,618,000 tons.

The character and attitude of these seams is such that very probably, as much as 85 per cent. of the coal can be actually taken out.

That is  $124,618,000 \times .85$

=105,925,300 tons that can be mined or

2,000 tons a day for over 175 years.

It must be borne in mind, however, that there is more coal available in adjoining territory which can only be mined through this property, and the Coal Lands Regulations are such that this adjoining land cannot be tied up by speculators, but will be available for lease when required. The amount of coal from this source will more than double the total above given. The measures will not be entirely free from disturbances, but taken as a whole the condition and altitude of the seams are favorable as far as can be judged by

surface showings and from the development work done.

The Bighorn coal is of high grade bituminous quality, closely resembling the best of the Crow's Nest coals from Fernie, B.C. It will probably yield a higher percentage of coke than any clean coal so far known in North America.

In all probability the dip of the seams throughout the main north-western portion of the Bighorn field will be steep enough to allow the back-balance system of mining. In the southern part of the field, where the dips become less, compressed air hoists may be employed until the dips are less than  $10^\circ$ , after which by driving "slants" the coal can be gathered by horse haulage.

The cost of opening up the Bighorn mines to a daily capacity of 2,000 tons will be practically the same as for the Kananaskis, that is, for an up-to-date plant with the best type of machinery, it will be about \$1,500,000.

If one-third of the output is to be coked the cost of the ovens completely installed will be from \$300,000 to \$500,000, making a total cost of from \$1,800,000 to \$2,000,000.

#### Brazeau.

To the south of the property the coal-bearing rocks are badly disturbed, and this disturbance extends into the property itself for over a mile, decreasing in intensity.

More than twenty coal seams in all were uncovered during the season. Most of them on the banks of George River. The gross total of coal in this section is 86 feet, and of this amount 60 feet in 8 seams is workable.

Making allowance for the loss of the disturbed area and for the lands extending beyond the outcrop of the coal, there is approximately an area of 2,000 acres of productive coal lands. Taking 60 feet as the workable thickness we have—

$2,000 \times 60 \times 1,500$  (tons per foot acre).

=180,000,000 tons

+10% for dip of seams

=198,000,000 tons.

Taking 85 per cent. as the proportion that can actually be extracted, we have  $198,000,000 \times .85$

=168,300,000 tons or 4,000 tons a day for over

140 years.

The Brazeau coals, like those of the Bighorn, are of high grade bituminous quality, and show equally good coking properties. The ash in nearly all cases is terracotta colored, or, as popularly termed, they are red ash coals. Samples were tested at Fernie, B.C., and give in each case a bright and exceptionally strong coke.

The Canadian Northern Railway is to be extended into the Brazeau field and the Grand Trunk Pacific now under construction will pass within 65 miles of the property.

The grade of the valley of the South Brazeau, where it crosses the property, is about 1 to  $1\frac{1}{4}$  per cent., which is well suited for a colliery yard, and there is an easy approach for a railway.

The building of the Canadian Northern into the Brazeau field will open up at once a great market for this coal.

Beside the markets for coke in Canada and the United States, the Brazeau and Bighorn will be in the best position to fill the demand for coke in the Telkwa Valley when the large bodies of lead and copper ores there are smelted.

By far the greater part of the coal must be taken from the slope workings. The angle of dip is well suited to the back-balance system of mining.

# MINE ACCOUNTING.

By John G. Grant. B.A.\*

(Continued from last issue.)

## II.

All the goods bought by a mining company to carry on its operations from day to day are called "stores." Timber, explosives, coal, ropes, tools, etc., are examples of what is covered by this general name. In preparing the revenue account for the year at the head office, the total cost of stores consumed during the year and the stock on hand at the end of the year must be known. In order to supply this information, records must be kept at the mine of all stores received there and all stores distributed. Also, a book or books must be kept showing what the estimated stock on hand is at any time for any class of goods. This latter is necessary from the fact that the orders and payments for stores, are issued, not from the mine, but from the head office, and to keep a supply on hand sufficient to meet any requirement, a knowledge of the quantity on hand, at all times, of any article, is necessary.

To record the receipt of stores either a loose-leaf or

"Stock Received" book may be used. In the case of the loose-leaf book it must be so arranged that two copies of each entry will be made, the original to be placed in the loose-leaf binder and the duplicate, (carbon copy) sent to the head office. Where the bound "Stock Received" book is used, the book itself or a certified copy of it must be sent every month to the head office. The reason for notifying the head office regularly of the receipts of stores is that all invoices are paid from there, and these invoices must be checked for prices and amounts before payment can be made.

Since the average storekeeper at a mine has no extensive knowledge of accounts, and since his duties are varied to such an extent that his bookkeeping is done "when he has time," I have deleted from the common forms of ruling the under-mentioned books all subdivisions not absolutely necessary. The form of the "Stores Received" book shown below is, I think, quite comprehensive enough for practical purposes:—

Stores Received Book

| Date | Name | A/c Charged | Filed in Ledger | Quantity |        | Description |
|------|------|-------------|-----------------|----------|--------|-------------|
|      |      |             |                 | No       | Weight |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |
|      |      |             |                 |          |        |             |

It will be noticed that the storekeeper is not concerned in any way with the cost of the goods received. His business is to keep an account of the quantities and weights and to keep separate the different classes of goods received. The latter requisite is satisfied by the entry in the "Accounts Charged" column. In this column is entered the name of the articles received, such as wire rope and hemp rope, hammers, shovels, etc., and a separate account opened for each in the "Stores Ledger" mentioned below.

The distribution of stores provides an opening for

dishonesty and waste, particularly the latter. If the goods were handed out at the request of any workman, no adequate check can be made as to what quantity should be on hand, and as to the rates of consumption of any class of goods. No stores should be delivered by the storekeeper except on a requisition signed by the mine manager or some responsible foreman. These orders should be made and signed in duplicate by means of a carbon sheet, one to be handed to the storekeeper, the other to be kept by the manager. The requisition form may be prepared after the following form:—

| Requisition for Materials |        |             |                  | No.  |
|---------------------------|--------|-------------|------------------|------|
| Quantity                  |        | Description | Where To be used | Date |
| No                        | Weight |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |
|                           |        |             |                  |      |

Signature .....

It is imperative to demand requisitions for all stores distributed. Workmen will be much more careful in the use of explosives, etc., when they have to ask the foreman to sign an order for each new supply. Also,

contracts made for sinking shafts, etc., on the basis of the company supplying the stores leave an opening for

\*Chartered Accountant, Toronto, Ont.

a wasteful use of stores which can only be curtailed by the storekeeper insisting on a requisition signed by the company manager. Contracts like the latter are seldom made, and this very fact would aid the contractor in rushing his work at the expense of stores he does not

have to furnish, without being detected and called to account.

These requisitions are entered in a "Stores Delivery" book, of which the following is a simple and sufficient form of ruling. This is, like the "Stores Received" book, a bound volume.

| Stores Delivered Book |            |              |       |          |        |             |
|-----------------------|------------|--------------|-------|----------|--------|-------------|
| Date                  | Where Used | A/c Credited | Folio | Quantity |        | Description |
|                       |            |              |       | No.      | Weight |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |
|                       |            |              |       |          |        |             |

The column, "Where Used," is most important, as each shaft, cross-cut, main level, drain, etc., should be charged with the materials from the storehouse used in making them when making up costs at the end of the year. The column "Accounts Credited" is just the same as the "Accounts Charged" column in the "Stores Received" book.

A book called the "Stores Ledger" is kept, to which both of the above books are posted, the folio column in each book having numbers referring to the page in the Ledger on which is kept the particular account mentioned in the "Accounts Charged" and "Accounts Credited" columns. The receipts are posted to the debit of the accounts, and the deliveries to the credit of the accounts. The difference between the two must

be the stock on hand at any time. Of course, the difference is of no value unless the books are kept posted up all the time, as they should be. If posting is neglected, requisitions will be sent in to the storekeeper for goods which are not on hand. When goods are ordered through the head office and several days must necessarily elapse between the giving of the order to the head office and the receipt of goods. Close watch must therefore be kept and requisitions sent to the head office for goods, the stock of which is running low, in ample time for the goods to be received before the balance is exhausted. This may mean the saving of several days' time on contract work, etc., and the result is obtained by the storekeeper simply keeping his accounts posted up to date. The requisitions sent to the head office should be as follows:—

| Storekeeper's Requisition |                        |                               |                     |               |         | No.<br>Date |
|---------------------------|------------------------|-------------------------------|---------------------|---------------|---------|-------------|
| Article                   | Date of<br>Last Supply | Quantity<br>of<br>Last Supply | From Whom Purchased | Present Stock | Remarks |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |
|                           |                        |                               |                     |               |         |             |

At the close of the year the inventory of stores on hand is taken, and the Stores Ledger balances afford a most valuable check on the accuracy of the stocktaking. An explanation should be given for any discrepancies shown by the check, and there will always be a

few differences, no matter how carefully the work during the year has been done.

In the next article I will take up the questions of wages books, analysis of costs, and the forms to be sent to the head office.

(To be continued.)

### MINE WATERS.

By A. C. Lane, State Geologist of Michigan.

Abstract by R. E. Hore, Dept. Geology, Kingston, Ont.

At the June, 1908, meeting of the Lake Superior Mining Institute, Dr. Lane read a paper which contains an abundance of data regarding the waters of the copper and iron mines of the Lake Superior district.

A large number of chemical analyses are given and it is shown that both in iron country and copper coun-

try the surface waters are comparatively soft. With increasing depth the amount of chlorine increases. The calcium percentage increases also, so that we may say that calcium chloride is present. These waters seem to have been buried with the strata, and may be called connate waters. At depths greater than fifteen hundred feet their strength is not uncommonly greater than that of sea water.

Of the numerous analyses discussed in the paper two are here given as typical of the lower and upper levels:

No. 96 Quincy Mine, dripping on 55th level, north of No. 6 shaft. Analysis by Dr. Fernekes.

Total solids determined 1.350 " " "

Two facts stand out very prominently. The much greater percentage of chlorides in deep waters and the reversing of the quantitative relations of calcium to sodium.

In No. 96 it is worth noting that calcium and sodium chlorides form 99 per cent. of the total salts, and sodium bromide three-fourths of the remainder.

The determination of the character of the mine waters has aided materially the study of the origin of the ore deposits.

It seems safe to assume that some of the Keweenaw

wan conglomerates and amygdaloids were filled with sea water and contained some chlorides. Warmed by heat given off from slow cooling lava sheets, these waters attacked the lavas and produced the chlorite and zeolites so characteristic of the melaphyres. Hence much of the water was absorbed, in formation of hydrous minerals, and what remained was relatively stronger in chlorides.

On further cooling water was drawn in from the outcrop and a second set of alterations took place with deposition of minerals at the contact of the soft and hard waters. Copper deposited especially with calcite prehnite and epidote.

The formation of copper from chloride solutions has been accomplished in the laboratory by Dr. Fernekes. The end products are actually the common products of the veins and the most abundant constituent of mine waters—calcium chloride.

In the secondary changes of the mine waters and in all the reactions leading to the deposition of copper there was accumulation of sodium in the mine waters. After the copper was formed sodium accumulated to such an extent that sodium minerals were precipitated.

R. E. HORE.

### SUCCESSFUL USE OF THE "BRAT" OXYGEN REVIVING APPARATUS.

(Excerpt from "Gluckauf" of January 30th, 1909).

The "Grossherzog von Sachsen" Colliery, Dietlas, Germany, report that a successful demonstration of the usefulness of the "Brat" reviving apparatus recently occurred at this time. On the 27th November a number of the workmen were more or less asphyxiated by a sudden outburst of carbon-dioxide gas. Some who had already been given up for dead by the doctors were brought back to consciousness and their lives saved by the use of this device.

The "Brat" apparatus is made by the Westfalia Company, and differs from the first forms of simple oxygen administration in that not only is pure oxygen under pressure forced into the lungs of the unconscious person, but by the use of an injector the compressed oxygen stream is used to exhaust the lungs of all poisonous and deadly gases which have been breathed in. Briefly, this apparatus will strongly deflate and inflate the lungs of an unconscious person, and simulate natural breathing.—Communicated to "Gluckauf" by Bergassessor Grahn.

## BOOK REVIEWS.

**Metal Statistics, 1909.** Published by the American Metal Market and Daily Iron and Steel Report, 81 Fulton Street, New York.

From statistics issued by prominent authorities, particularly from the reports of Messrs. Henry R. Merton & Co., Limited, Aaron Hirsch & Sohn, and other like sources, this handy little pamphlet has been compiled. To the buyer or seller of metals it should be invaluable.

The metal section includes figures dealing with the production, consumption, and price movements of metals. Iron and steel, copper, tin, spelter, lead, silver, antimony, metal duties, and price equivalents are the headings.

**Economic Geology of the United States.** By Heinrich Ries, A.M., Ph.D., Professor of Economic Geology at Cornell University. Second Edition. 451 pages. Illustrated with half-tones, maps and diagrams. Price, \$2.60 net. Published by the Macmillan Company of Canada, Limited. Toronto, Ont., 1907.

In the second edition of Dr. Ries' book the statistics have been brought more nearly up-to-date, and all observable errors have been corrected. Also a second appendix has been added, containing a list of the more important papers published since the appearance of the first edition.

The ground covered corresponds with that gone over in the elementary course in economic geology in

Cornell University. Non-metallic minerals are given precedence over metallic minerals. Modes of occurrence geographical distribution and uses of minerals are given due prominence.

Dr. Ries confines his attention exclusively to the United States. Doubtless the inclusion of information bearing upon other countries would have made a much larger volume necessary. Yet it is probable that had the author added a chapter or two on Canadian and European minerals and mineral markets he would have enhanced the value of his work.

"Economic Geology of the United States" has filled a specific demand across the border. It should be read by Canadian educationists. The need of some such publication on Canadian economic geology was never more apparent.

**Gold: Its Geological Occurrence and Geographical Distribution.** By J. Malcolm Maclaren, D.Sc. One colored plate and 278 illustrations; 687 pages. Published by The Mining Journal, London, England. 1908. Price, 25 shillings net.

The systematic study of ore deposits has become one of the chief activities of modern geologists. In many cases the owners of large mines employ economic geologists to control exploratory work. Thus the economic phases and applications of geology are occupying more and more attention. This is as it should be.

Dr. Maclaren has written this volume on "Gold" with the object of arranging scientifically data already published, and of presenting facts not before known by his readers. He tells us in his preface that "it is believed that absolute progress in the science of ore-deposits will, in the future, be made largely, if not entirely, by induction reasoning." He sets out, therefore, to arrange, in readily accessible form, the salient facts of the deposition of gold.

The book falls naturally into two parts. Part I., which occupies 117 pages, defines the general relations of gold deposits. First the broad principles of cosmology are considered. Then fissures, underground waters, fissure filling, secondary enrichment, are touched upon. After further treating the physical and chemical qualities of gold and of compounds of gold, a classification of gold deposits is given. This closes Part I.

Part II. consists of a descriptive outline of the gold deposits of the world, arranged by continents. Wherever the importance of a district warrants it, geological data, mining conditions, costs, etc., are given. The book is profusely illustrated.

There can be little question as to the need of boiling down the stupendous mass of geological and mining literature that has been produced, and is being produced. Much that is worth preserving would be lost to the reading public were it not for the energy and enthusiasm of men like Dr. Maclaren. Compilation of scientific data is a task for which few men are fitted. It is irksome work. The conscientious compiler is not unlike the mountain that labored and brought forth a mouse. He must read countless periodicals and look up numberless references. He must condense and select and reject from masses of figures and facts. Then he must mould the residue into a coherent and balanced whole.

Dr. Maclaren, unlike most English writers on technical subjects, gives evidence of having followed closely the best literature of his own and other countries.

His bibliographical references are exceedingly complete and creditably up-to-date. To say the least, this is not generally the case with our trans-Atlantic brethren. Too often their citations from other authors date back ten, twenty, or thirty years, and do not include recent writers at all.

In Part I. the author's treatment of the origin of auriferous deposits is clear. His diction is dignified, his style forceful, and his reasoning convincing. That he has acquired a thorough knowledge of the science of ore deposition is apparent from the appositeness of his allusions, and the skill with which, in very limited space, he sketches the present status of the science.

We have stated that Dr. Maclaren's style is commendable. In one respect, however, it is open to criticism. This is his frequent use of the split infinitive. It may be argued that this is an infirmity of many great and good writers. Nevertheless, it is a fault as ungraceful as it is unnecessary.

We believe that Dr. Maclaren's book will speedily be recognized as a sound, capable and comprehensive treatise on a subject that will never lose interest.

**Mining Methods in Europe.** By Lucius W. Mayer. Mining Engineer, 169 pages, illustrated with drawings and photographs. Hill Publishing Company, 505 Pearl Street, New York. Price, \$2.50 net.

The general scarcity of literature on the subject of underground attack incited Mr. Mayer to write this volume. Mr. Mayer, after extended journeys of observation through Great Britain and parts of Europe, has described, from an American point of view, some of the more interesting and important mining methods of Europe.

Ninety-four pages are assigned to descriptions of mining methods in England and Wales. The remainder of the book touches on various phases of mining in Germany, France, and other countries.

Whilst nearly every chapter contains useful data, Chapter VI., "Longwall Methods of Mining Flat Seams," is particularly suggestive. We concur heartily with the author that the advantages of this system are not appreciated on this continent. Canada is probably ahead of the United States in coal-mining practice, but both countries have much to learn from Great Britain and Europe.

"Mining Methods in Europe" is not a compendium of European mining practice. But it contains many descriptions that should prove helpful, especially in Canada. The book is exceedingly practical and, because of the variety of subjects treated, it is easily readable. It is essentially a mining engineer's book.

We cannot forbear noticing that Mr. Mayer is needlessly inexact and inaccurate in his use of words. On page 24 and 25, occurs the sentence, "The possibilities . . . is not beyond reason." This may be merely a typographical error. But on page 29 we find the word "infers" misused. In describing "Retreating Longwall," Mr. Mayer writes thus: "In general, retreating longwall infers," etc., etc. "Implies" and not "infers" is obviously what is meant. On page 30, also, there is an inexcusable blunder. Only from the context is it possible to guess what Mr. Mayer is driving at when he states that "Not alone does the action of the air ameliorate the quality of the coal . . ."

Whilst these symptoms of literary sloppiness cannot be overlooked, we do not hesitate to commend Mr. Mayer's book as highly practical, interesting, and, in matters of technical detail, carefully wrought.

## PERSONAL AND GENERAL.

Mr. H. L. Brown, E.M., has been appointed manager of the Silver Cross Mine at Cobalt. Mr. Brown has had experience in the United States and Mexico, and is said to be one of the best in the profession.

The Secretary of the Canadian Mining Institute has forwarded us the following communication. It appears only at the urgent solicitation of a number of literary Canadians. Hereafter we shall charge advertising rates for all flowing numbers:—

Dear Mr. Lamb,—I have spent several most delightful hours since yesterday reading your notes on the trip. They bring back so many pleasant memories, and some of them so vividly that they seem to have produced a temporary "brain-storm," during which I have semi-consciously jotted down some supplementary notes, as per attached slip:—

'Twas on the plains of Calgary,  
Out westward quite a way,  
Some engineers both brave and proud  
Had stopped to spend the day.

A cattle king, Pat Burns by name,  
Had hailed them as his guests.  
"My friends," said he, "of cowboy fun  
I think we'll go in quests."

"Yes, yes," they cried in unison,  
"This is the woolly West.  
Bring forth your cowboys, bronchos, steers,  
We'll have naught but the best."

"'Tis well," cried Pat, and in his eye  
There danced a little gleam.  
"Go on there, men, just let 'em out;  
We'll show what's to be seen."

But hark, there comes a muffled roar:—  
"The steer!" A cloud of dust,  
And each brave feels his only chance  
Is climb, or run, or bust!

One sprints behind a friendly pole,  
'Twas a record-breaking dash.  
Could he repeat it? I think not,  
Though great the prize in cash.

Another climbed the stoutest post,  
And grinned in fiendish glee.  
Said he, "While I am up thus high,  
The steer, he can't get me."

A third one, gentle as a Lamb,  
Was—well, we don't know where.  
But anyhow he took some notes  
Which were preserved with care.

And these, prepared in faultless style  
Under his watchful eye,  
Will not permit us to forget  
The trip of the C. M. I.

Yours sincerely,

II. RIES.

Judges of literary merit will have no difficulty in conceding that Dr. Ries' great epic entitles him immediately to take rank with such distinguished poets of this class as Homer, Dante, and Mr. J. C. Murray. He

has unquestionably a brilliant career before him. His style is dramatic, yet smooth and even. His disregard for the conventional laws of metre evidences genius. The only fault we have to find—and this no doubt may be attributed to youth and inexperience—is that the climax is tame and unworthy of what comes before; and, while admitting that to take liberties with the original production of genius is a proceeding not as a rule to be countenanced, we have considered the circumstances sufficiently important to suggest to the author the addition of the following lines:—

But the true hero of this tale,  
With modesty most rare,  
Omits to note in the above  
What he was doing there.

How single-handed, quite alone,  
He circumvented that steer,  
And rescued from a tragic fate  
A gallant engineer.

And thus the Ries-on "why we're here"  
Remains for me to tell.  
We're here because we took along  
A brave man from Cornell.

H. M. L.

## CORRESPONDENCE.

To the Editor Canadian Mining Journal.

Dear Sir,—The Hon. Mr. Drummond's letter, which appeared in the Montreal Star, and also in the issue of the Maritime Mining Record of January 13th, on the development of Wabana Mines, by the Nova Scotia Steel and Coal Company, is certainly interesting from more points than one.

It seems to me that a little further explanation is necessary before the public, like a boa-constrictor, can swallow a goat, horns and all.

First, Mr. Drummond says, "The extent of the Scotia's areas is some 38 miles." The mine map (dated early in 1907), from the Newfoundland Government, shows the company's submarine holdings to be 19 areas, of one-half square mile each. These, together with the whole total area of Bell Island, would not make the extent of area as given in Mr. Drummond's letter.

We are pleased and proud of Mr. Chambers' record-breaking feat in driving the slopes, but I fail to see how one pair of slopes, driven on one vein just to tap the area of 9½ square miles, can prove the extent of the three veins supposed to be contained therein; particularly when one of these veins over-lies the one on which the slopes were driven. If this is true of Wabana, why will it not apply to Nova Scotia? I will venture to say that Mr. Drummond has knowledge of more than one pit, trench, or shaft in Nova Scotia, that has tapped more than eleven feet of ore, with greater length of vein than is shown by the pair of slopes driven at Wabana.

Again, Mr. Drummond says, the driving of these slopes had an element of risk. "Who knew how soon a fault or clear cut-off might be encountered?" Has this element of risk been totally removed? The length of these slopes to tap the submarine areas is 5,160 feet. To get through to the outer boundary the distance is something over 6,000 feet. The extension east and west, as given by the Mines map, is three miles, yet we would infer from Mr. Drummond that the element of risk has all been removed. I would like to ask in Mr.

Drummond's own words, in the further development of these areas, "Who knows how soon a fault or clear cut-off may be encountered?" Also, who knows how much and what kind of a roof is over the upper vein, or if there is sufficient to allow it to be worked with safety?

Another point in Mr. Drummond's letter which is hard to understand, that is, how he makes his calculations to get 2,500,000,000 tons of ore.

He says, "The sinking of the slopes has proven beyond peradventure that there is ore of excellent quality in twenty square miles of the company's areas, with the probability, amounting to almost a certainty, that the three seams underlie all of the remaining eighteen miles of the territory."

Let us assume that the total area, twenty square miles, as containing three seams having an aggregate thickness of twenty-five feet. Twenty square miles equals 557,568,000 square feet, or multiplied by the thickness of the ore, equals 13,939,200,000 cubic feet. The specific gravity of Bell Island ore is 4.14, or 258.75 pounds per cubic foot. We, therefore have:

$$\frac{13,939,200,000 \times 258.75}{2,000} = 1,803,384,000$$

tons as the possible total that could be contained in this area.

As it is impossible for the company to have this area at Wabana, let us get down nearer the facts.

In 1899 the Nova Scotia Company sold to the Dominion Steel all their holdings at Wabana, excepting the upper (now middle) vein. They afterwards secured 19 submarine areas, of one-half mile each, being beyond those sold to the Dominion Steel and the Dominion Steel secured five more areas again beyond and adjoining those taken by the Nova Scotia Company.

In 1900 the Nova Scotia Company equipped and began operating the middle or upper vein, and have carried on extensive operations ever since. This vein has a total length on outcrop of a little over 7,000 feet, and a width considerably less than one-half mile.

For easy computation, although excessive, let us say the company has a total area at Wabana of ten square miles. It will be readily seen, that instead of having 1,803,384,000 tons as above, we only have 901,692,000 tons, as the quantity of ore at twenty-five feet in thickness that would be possible for this area to contain.

But this quantity cannot be considered available. I think Mr. Drummond will agree with me that if the company can win seventy-five per cent. of this they will be doing remarkably well. We, therefore, have as an available ore supply 676,296,000 tons less the amount already taken from the land area, and less the difference between the estimated twenty-five feet over the whole areas and the known average thickness (8 feet) of the one vein which the company own on the land area. Of course, this is all, providing there are no faults, clear cut-offs, etc., etc., in the submarine areas, and that there is sufficient roof over the upper vein to work them with safety.

Yours respectfully,  
W. F. JENNISON.

Truro, N.S., Feb. 12th, 1909.

#### MINERAL VEINS IN THE MONTREAL DISTRICT.

It would probably be difficult to find more striking examples of the value of criticism and discussion than the two papers by Dr. Barlow and Mr. Hore that appeared in recent issues of the Canadian Mining Jour-

nal on the above subject, as the result of my letter in your issue of December 15th. These two papers are important contributions to the literature of our cobalt-silver ore deposits, and should be read by everyone who is interested in the character of these deposits.

The letters undoubtedly clear up several points which were somewhat obscure in the original papers, and Mr. Hore's excellent classification of the mineral veins adds greatly to the clearness of the subject, and forms a basis for further discussion.

It is evident that Mr. Hore and I are essentially in accord as to the character and origin of the mineral veins, except in the matter of names; but, as the clear and distinct use of names is necessary for the proper representation of ideas, it may be well to say a few words farther on this point.

With regard to the present usage of the words like "dike" and "vein," Professor J. F. Kemp, in his "Handbook of Rocks," third edition, 1906, page 182, gives the following definition of dikes: "Intrusions of igneous rock in fissures, not to be confounded with 'veins,' which are precipitated from solution." On page 15, he again says of dikes: "They, therefore, constitute elongated and relatively narrow bodies of all sizes, from a fraction of an inch in thickness and a few feet in length, to others a thousand or more feet across, and a mile in length." Chamberlin and Salisbury, *Geology*, Volume I., page 564, express themselves thus: "Fluid rock forced into fissures and solidified there, forms dikes." Norton, *Elements of Geology*, page 261, has this: "The sheet of once molten rock with which probably a fissure has been filled, is known as a dike."

It is true that some of the older geologists use the terms "dike" and "vein" rather loosely and interchangeably; but with modern geologists the general usages are those given by Prof. Kemp in the quotation cited above. And both Dr. Barlow and Mr. Hore agree with me in considering that the aplite or pegmatite filling the fissures in the Montreal River District has flowed into these fissures as a molten igneous rock, and, therefore, by the definition given above it has formed "dikes." They also probably agree with me in considering that the calcite veins were deposited from aqueous solutions, and are true veins.

It is, therefore, advisable to conform to the general usage of geologists and authoritative writers on ore deposits and call these narrow aplite bodies dikes and not veins.

In regard to the probability of silver being formed by magmatic segregation from the aplite, Mr. Hore says in effect that the meanings which we apply to the phrase are different, and he explains that he meant a magmatic concentration of the silver, etc., in the residual fluid portion of the diabase before it solidified completely, rather than the "fractional crystallization," which took place in the formation of the Sudbury nickel deposits. The theory of the magmatic segregation of ore deposits was elaborated very fully by Dr. Barlow himself in his study of the Sudbury nickel ores, and in a discussion of his and Mr. Hore's papers, it was only reasonable that I should take the Sudbury deposits as types of the process. But it is not necessary to take my unconfirmed statement with regard to the meaning of this phrase. Dr. Barlow himself defines magmatic differentiation as follows: "The division or differentiation of a more or less viscous magma or fused mass of rock, into chemically and mineralogically diverse parts, which on cobbing yield correspondingly different types of rock."

(Nickel and Copper Deposits of the Sudbury Min-

ing District. By A. E. Barlow, Ann. Rep., G. S. C., Volume 14, Part H., page 125, 1904.)

Dr. R. Beck, in the "Nature of Ore Deposits," 1905, page 11, writes of magmatic segregation as follows: "In some cases of concentration of the ores, either into stock-like masses or into bands has taken place in the rock either before or during its solidification from the molten condition; then magmatic segregation or secretion being of primary origin, will be considered first in this work," and "Although concentrated in compact masses, the ore of these magmatic deposits is exactly the same as that which occurs in sparsely-scattered particles through the enclosing rock, in which the ore minerals are necessary constituents."

"This particular fact is the most important argument for the truly primary nature of such deposits, and enables one to discriminate between magmatic segregation and those accumulations of ore that have been formed through secondary processes in an eruptive mass."

Thus it will be seen that the ore must have been a primary constituent of the molten rock, and must have been separated out where it is at present found. If it has been precipitated from aqueous solution after the rock had solidified, the phrase "magmatic segregation" as defined by Barlow and Beck, does not apply. Now if it can be shown that the silver is a primary constituent of the aplite, such evidence would be an exceedingly interesting addition to our knowledge of silver deposits. But Dr. Barlow does not seem to me to prove this, and Mr. Hore, in his original paper, states that: "The ores were deposited from solutions which followed the aplite intrusions"; and in his last letter "it is implied that silver was in solution after most of the magma had solidified."

Dr. Barlow does not use the term "magmatic segregation," but he makes the definite statement that "not only the native silver, but also the characteristic sulphides and arsenides began to be introduced with the first pegmatite (aplite) filling. These metallics did not wait for the reopening of the pegmatite, and the introduction of more abundant aplite." "The pegmatites . . . are themselves the ore bringers." These statements seem to me clearly to imply the presence of primary metallics in the pegmatites, and consequently the existence of a type of silver-bearing deposit unknown, and until very strong proof can be shown of the existence of such conditions it seems more rational to accept the present explanation of the formation of such veins; namely, that they are formed by deposition of the minerals from aqueous solutions subsequent to the formation of the pegmatite (aplite) dikes.

I accept with pleasure Dr. Barlow's statement that there was no uncertainty in his mind as to the laccolitic character of the diabase; but it was quite impossible, without explanation, for me to undersand his use of the word "profound," for it does not appear in any dictionary accessible to me as a synonym of "widespread." The Imperial Dictionary gives its meaning as "deep . . . descending far below the surface . . . having great depth." No indication of any meaning which would indicate horizontal extension is given, neither would the original derivation of the word indicate such meaning.

J. B. TYRRELL,

Feb. 19th, 1909.

9 Toronto St., Toronto.

Editor Canadian Mining Journal:

Dear Sir,—In your issue of February 15th I have read with some interest a letter from Mr. E. Percy Browne, criticizing Prof. Haultain's article on "The Mill Test for Gold versus the Assay."

In the course of this, Mr. Browne says that he has been following for three or four years mine sample assay values in a large gold mine, comparing them with actual results. He says that "though these samples were taken as carefully as possible, always taking large samples, usually in duplicate, the results did not accurately represent the value of the ore." Farther on he quotes a paper by Prof. Richards and Mr. Bugbee, showing "the impossibility of valuing a free milling gold ore by sampling and assaying." This quotation is in italics, which I take to be Mr. Browne's, and from this I infer that the words quoted accurately represent his opinion.

There are one or two points which, to my mind, require elucidation. Are the samples in the mine referred to by Mr. Browne taken systematically at close intervals in all shafts, drives, raises and winzes on the vein? If they are not, then I cordially agree with Mr. Browne, that they are of little value, however large they may be.

If they are taken systematically, then what is the nature of the deposit worked? Is it a quartz vein, and, if so, how wide is it? If it is so wide that one ordinary-sized drift will not expose both hanging and foot walls, then samples, even though taken at regular intervals, will not cover the whole width of the vein, and so will be incomplete and unreliable. Or again, are the gold values very unevenly distributed throughout the ore? In such a case, samples, unless taken at very close intervals, would no doubt be little more than an indication. But I think that all these points must be considered before making or quoting such a sweeping assertion as that of Messrs. Richards and Bugbee.

Probably in no gold mining centre in existence is mine sampling more systematically and successfully carried out than on the Witwatersrand; and it is invariably found there that the results obtained in ore valuation from systematic mine sampling fully justify the reliance placed in it by mine managers and consulting engineers.

Samples are taken at 5-foot intervals on all workings on the Reef, and large scale stope and assay plans are kept, on which the full particulars of each sample are entered at the spot whence the sample was taken; and the theoretical gold content of any block of ore as calculated from the assay plan always tallied closely, in my experience, with the actual gold extracted from the battery and cyanide works.

In the development of new properties mill tests are never dreamed of, as the system of sampling is considered to give as accurate an idea of the value of the ore as any mill test would.

I was a sampler myself first, and later a surveyor, on two of the best known mines on the Rand; as the one I took the samples, as the other I had the making up of all the returns from the mine, mill, cyanide and assay office, and I can testify to the accuracy with which a valuation of a free milling gold ore can be made by this method, given suitable conditions and proper care.

Furthermore, a one or two ton sample for a mill test, to be really representative of the ore mined, should be taken, like the mine samples, from many different places in the workings, care being taken that the sam-

ples from the different places are approximately equal, to prevent any part of the mine being unduly represented in the composite sample sent to the mill. I will venture to say that in nine cases out of ten no such elaborate selection is practised, the ore for the mill test being taken probably from the bottom of a shaft, or the face of a drive, and, therefore, being of about as much value as one isolated mine sample taken at the same spot would be.

Apologizing for taking up so much of your valuable space,

Yours truly,

J. D. RAMSAY.

Traders Bank Bldg., Toronto, Ont., Feb. 22, 1909.

Editor Canadian Mining Journal:

Dear Sir,—In the Canadian Mining Journal of February 1st, I noticed your paragraph regarding an article written by Mr. Alex. Gray, in which he attempts to instruct the Crown Reserve how to figure its cost of production. Your correspondent says: "I do not care to take sides in this controversy." I wish to state that there has never, at any time, been any controversy between Mr. Gray and myself. As general-manager of the Crown Reserve Mining Company, I presented a yearly report to the stockholders of the company, extracts from which were published by the newspapers. Without taking time to see the report, and probably to demonstrate his "keen scent," Mr. Alex. Gray at once published an article in the Montreal Star, in which he attempted to criticize my statement of costs, a matter with which he was not familiar. The natural result was that his deductions were absurd.

I am, as you know, not a newspaper writer, and have neither the time nor the inclination to start what you call a "controversy," but I know that you are interested in the facts, and that you will "take sides" with the truth, so am enclosing a copy of the ore production and cost sheet taken from my annual report, which gives shipments and values in detail, together with mining costs.

Trusting that this will make the matter clear in your mind, I am,

Yours very truly,

SAMUEL W. COHEN.

### COAL AND COKE DIVIDEND.

A dividend of 1 1-4 per cent., or \$35,000, was paid on the stock of the International Coal and Coke Co., on Monday,

February 1. The company previously paid in dividends \$336,000, which, with the present dividend, makes a total of \$371,000.

## INDUSTRIAL PAGE.

RENOLD BLOCK-CHAIN.

**Renold Driving Chains**—Hans Renold, Ltd., Manchester, England. Jones & Glassco, Montreal, Canadian Agents.

The manufacture of chains for textile machines was begun by Mr. Hans Renold in 1879, with a staff consisting of one man and a boy. In December of the same year a chain was supplied to James Starley for use on his first chain-driven cycle. Since that year the Renold works have grown from a small rent-

RENOLD ROLLER-CHAIN.

RENOLD SPRING-WHEEL PARTLY ASSEMBLED.

ed room into an establishment employing 700 men. The output of the factories is confined to chains, sprockets and sprocket cutters.

Apart from the greater general efficiency claimed for chain-driving, and its known advantages over spur wheels, it is often the only satisfactory method where oil, moisture, or heat are present.

The Renold Catalogue explains fully the principles involved in the three types of chains mostly used, the forms of sprocket teeth, and the principles of chain gearing, etc. Installations of chain-drive in the Renold plant are described at some length, and outside installations are touched on in the concluding section of the catalogue.

The accompanying illustrations will prove interesting to all users of power.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

Glace Bay, Feb. 18.—Eight Hour Commission of Enquiry.—This commission have commenced their tour, and on the 15th of February they visited Cape Breton, taking evidence at the Steel Works in Sydney. The following day the commission visited Sydney Mines. On the 17th and 18th they held sessions at Glace Bay, where evidence was given by representatives of the P. W. A. and of the Dominion Coal Company. Dr. Magill, the chairman of the commission, is a painstaking gentleman, who takes his mission seriously. We think he will make a valuable report.

U. M. W. A. versus P. W. A.—War a l'outrance has been declared between the local labor organization and that from the States. The P. W. A. has lately adopted a stiffened attitude, and is awakening from its lethargy. It is gradually permeating the minds of the miners that for 20 years they have had industrial peace, coupled with a continual industrial development and a steady increase in the standard of living and the rate of wages, and the feeling of apathy with which the inroads of the U. M. W. A. were first regarded is gradually changing to a marked resentment at the present action of that body. Possibly never before in the history of organized labor has one union

made deliberate war upon another. In the present case the U. M. W. A. came uninvited into Nova Scotia, and has made a persistent endeavor to disrupt that province's native labor organization; has attempted through the courts to obtain possession of its accumulated funds, and has harried the native organization by every means in the power of an unscrupulous body of men with purely selfish ends to serve. The indignation of the P. W. A. members is therefore not at all to be wondered at, especially when it is considered that there are whole States in the Union where the miners are unorganized where the energies of the U. M. W. A. might very legitimately be employed.

**Journalese.**—One of the Sydney papers reproduced from some source unknown a beautiful specimen of "journalese" applied to mining. Some of the scientific information conveyed by the gem may be quoted for the guidance of mining students. We are told: "Mining engineers and chemists recognize three kinds of mine gases. They denominate these gases fire-damp, after-damp and white-damp. Fire-damp is the only one of the trio that is explosive. It is a gas given off by coal under the influence of the heat of the earth." This is somewhat interesting, and may be news to students of mine gases. Again, the writer tells us that a careless miner will sometimes tamp his shot with "paper instead of clay," which is the cause of many mine explosions! We are further instructed that after-damp is a non-explosive and irrespirable gas composed of carbo-lic acid gas. It is therefore no wonder it is so deadly. "Carbo-lic acid gas" must be a dreadful mixture. It is eclipsed, however, by white-damp, which our writer goes on to say is "a heavy white vaporous gas, plainly visible to a naked eye. It seeks the ground, and hovers there like the miasmatic vapors one sees where malaria abounds. It is non-explosive, but its fumes are deadly, and he who breathes it perishes instantly." This is truly wonderful, and it is a pity the author of this journalistic triumph did not meet a little white-damp before he commenced to instruct the public as to the nature of mine gases.

#### ONTARIO.

**Cobalt.**—The leases on the Peterson Lake are being worked steadily, and good results obtained. The Kerry Mining Co., which has a lease on the Peterson Lake, has struck a good vein of ore, about two inches wide, carrying cobalt and native silver, at 95 feet in depth.

The Crown Reserve has struck a new vein carrying high-grade silver. This company is installing a new Sullivan straight-line air compressor with a capacity of 1,200 feet of free air per minute.

The new plant at the Cochrane mine commenced operations on the 15th. The plant consists of a 60 h.p. boiler, a 25 h.p. hoist and a four-drill Ingersoll compressor. Sinking has been started in the shaft from the present 50-foot level, and the intention is to carry the shaft to the 150-foot level. The buildings at the mine are all complete, and a force of 16 men are at work.

A surface vein has been discovered on the John Black extension. The discovery consists of a cobalt vein carrying native silver, and varies in width from 9 to 14 inches.

Mr. Geo. M. Colvocoresses has been buying a plant of machinery for the Blackburn mine of Miller Lake. The plant consists of two locomotive boilers of 35 h.p. each, two Ingersoll straight-line compressors, with a combined capacity of 700 feet of free air per minute, two hoists and five drills.

The Bartlett mines in Gowganda has placed an order for ten machine drills.

The Wetlauffer mine in South Lorraine is going to put in a gas producer plant and a compressor.

Isaac H. Johnston, of the Boyd-Gordon property in Gowganda, has placed an order for an 80 h.p. boiler, a ten-drill compressor, a hoist and machine drills.

On the Bailey property, which is operated by the Cobalt Central, a short drift has been driven from the second level. The vein being developed is about 4 inches in width, and carries smaltite and silver. The Cobalt Central Concentrator, with the addition to the machinery, has now a capacity of nearly 100 tons per day.

The Nipissing Reduction Co., which is at present milling the dumps of the Nipissing Mines Co., is treating about 80 tons per day.

The Muggley Concentrator has just finished milling several thousand tons for the Nova Scotia mine. A meeting of the directors is to be held in Toronto on the 18th, and the question of doubling the capacity of the plant will be considered.

Mr. George Vanderbilt, of New York, was in Haileybury on the 14th, consulting with several of the prominent mining men of the district.

Mr. J. Obalski, of Quebec, was in Cobalt for a few days looking over some properties.

#### BRITISH COLUMBIA.

**Rossland.**—The shipments at the Centre Star mine are gradually approaching the standard tonnage, now that the smelter has treated all of the surplus ore that accumulated during the temporary shut-down. During the past week the Centre Star group shipped 3,370 tons, and it is the intention to increase this until the standard figure is again reached. Extensive development work is being done on the 15th and 16th levels of the Centre Star and the other deep levels of the company's property, and it is the intention to ship a much larger tonnage this year than during 1908, provided the copper market remains strong and the red metal approaches a normal price. The production of the Consolidated Mining & Smelting Co. of Canada, Ltd., for the calendar year 1908, embracing operations at the company's mines in Rossland, Moyie, Sandon and Phoenix, and the smelter and refinery at Trail, may be grossly figured at \$5,044,198. The lead stacks at the smelter turned out 51,022 tons, and the copper furnaces produced 267,384 tons. The metallic production was: Gold, 116,314 oz., value \$2,383,327; silver, 2,100,457 oz., value \$1,102,846; copper, 3,753,139 lbs., \$506,460; lead, 35,999,145 lbs., \$1,050,455, making a total of \$5,044,198.

The fuel supply at the Le Roi mine has improved, and most of the regular force has been put back to work again. Development work is being prosecuted with vim on the 1,750-foot level toward locating the continuation of the shoot that has produced such good ore on the 1,650-foot level. The company's consulting engineer, W. A. Carlyle, is in the camp, looking over the work and property of the company. The action of the Board of Directors of this concern in writing off the annual statement old figures that were mere stuffing is to be approved. The Le Roi mine has not yet seen its best days, and it looks as though the present Board of Directors were determined to clear up the office and recording end of the business so that the real situation at the mine can be readily ascertained by the average stockholder. It will no doubt take a little time to accomplish this, but in the end the operation will have a gratifying effect.

At the Giant-California last week W. Y. Williams, of Spokane, consulting engineer, went over the work in the mine. It is said that the results obtained so far in this work have not been all that the operators would like.

Messrs. Whitford and Jenkins have resumed work on the Blue Bird, and will do development work for a while, merely shipping what ore accumulated in the course of this work.

**Boundary.**—The Consolidated M. & S. Co. has resumed shipments to the Trail smelter from the Snowshoe mine. The B. C. Copper Co. shipped a small tonnage from the Oro Denoro last week, this being the first lot sent to the smelter since the cold weather. The manager of the B. C. Copper Co., J. E. McAllister, has gone East to attend the annual meeting, where it is ex-

pected some definite action will be taken in regard to the dividend policy of the company. The net earnings of the British Columbia Copper Co. for December were \$46,500. The production of copper by this concern during the last seven months of the calendar year 1908 was 6,731,351 lbs., and the net earnings were about \$232,609. They have about 6,000 tons of good ore lying on the dumps at the Athelstan mine, Wellington camp, where development work is proceeding with satisfactory results.

The Granby Company will very likely proceed with the work of enlarging the other seven furnaces at the smelter so that they will have the work finished early this summer. When this work is completed the capacity of this big smelter will be increased by over 1,000 tons, giving the company a capacity of 4,500 tons per day. The Granby Consolidated expects to mine and ship 25 per cent. more ore this year than was the case during 1908. The production during 1908 was 23,639,984 lbs. copper, as against 15,514,000 lbs. in 1907 and 19,779,000 in 1906, which was a comparatively heavy year. From this it will be seen the output for 1908 was 8,125,000 lbs., or about 52 per cent. more than in 1907. The Boundary output for 1908 was the heaviest in the history of that district, but 1909 bids to exceed that year unless more than the usual number of drawbacks intervene.

The Reorganization Committee of the Dominion Copper Co. plan to buy in the property of the company at foreclosure sale and transfer it to the New Dominion Copper Co., which will issue the following securities: \$500,000 of 6 per cent. 10-year income bonds, convertible into stock at \$5 par, and 250,000 shares of common stock, par value \$5. It is proposed to give the present bondholders new stock for their bonds on a basis of 210 shares for each \$1,000 bond. This will take up about 168,000 shares of the new stock. The company's creditors will receive 20,000 shares of new stock, in the proportion of 20 shares for each \$100 due them. The present shareholders, upon turning in their old stock and subscribing at par for the new bonds at the rate of \$100 of new bonds for each \$100 of the old stock, will receive a bonus of 10 shares of new stock. This will take about 50,000 shares; the underwriters will take about 12,000 shares, making up the total issue of 250,000 shares. This committee has been authorized to sell the property, if after thorough investigation as to working costs, cost of raising capital, etc., they deem it advisable, but they may not sell for less than \$800,000, so the report goes. It is rumored that the Consolidated Mining & Smelting Co. is making an effort to get hold of the property of this company and work it. The report is, anyway, that the mines will be in operation in five or six weeks.

**Nelson.**—The Montezuma, on Kaslo Creek, Maestro, No. 1, at Ainsworth, and the Bunker are being operated by H. Giegerich. Mr. Giegerich is getting excellent results from his operations on these claims. The management of the Krao Mining Co. is arranging a consolidation of adjacent mining properties with a view to driving a 1,500-foot tunnel into the property, which will tap the ore bodies of the Krao at about 1,200 feet depth, and will at the same time do away with a deterrent factor of mining in that locality—the water, which has flowed into the lower workings of the Krao to such an extent that it is not considered economical to try and pump it. The Krao was sold to Butte mining men about a year and a half ago for \$125,000. The Rambler-Cariboo mine in this district had the same trouble with water in the lower levels until the company drove its long tunnel, and many of the prospects in this locality cannot be worked out account of the heavy volume of water that gushes from the fissures in the rock at certain periods of the year.

The International Coal & Coke Co. paid another dividend of  $1\frac{1}{4}$  per cent. on February 1st, amounting to about \$35,000; this makes a total of \$371,000 profit that the company has shared with its shareholders to that date. The International Coal & Coke Co. has one of the most complete plants in the Crow's Nest district, and has worked steadily along while many of the other

properties have only worked intermittently. This concern has large reserves to open up yet, development work being advanced in this direction as time goes on.

The Yankee Girl Gold Mines Ltd., is shipping the product of the mine to Northport smelter. The future outlook for this property is bright, and the ore body looks better with every "shot" fired. The ore is being sacked—a couple of hundred sacks per day.

The Winslow group in the Lardeau has been bonded for \$60,000. Another gold brick, valued at \$4,000, was shipped from the Queen mine last week. Work is proceeding with the usual regularity at mine and mill at this property.

The spring snowslides in the Slocan have begun to move early, and have already carried away a number of buildings at the Hewitt mine, Silverton.

**Vancouver.**—Mr. C. H. Dickie, president of the Portland Mining Co., states that the company is negotiating for and will soon put in an aerial tramway and smelter at the property, which consists of 12 claims situated at the head of Portland Canal. A strong fissure vein carrying gold, silver and lead, has been developed on 6 of these claims, there being about 20,000 tons of ore available for stoping.

Forty promising mining claims situated at Maple Bay, Portland Canal, have been taken over by the Associated Mining Co., of London, Eng. Considerable development has been done on this group, and about 12,000 tons of good ore shipped out. It is the intention of the above-named company to equip the property and work it on a large scale in the near future.

## YUKON.

**Dawson, Jan. 1.**—The Dominion of Canada can well be proud of the splendid achievement of its most northwesterly domain, Yukon Territory, for the important work it has achieved during the year of 1908 and for the new work it is to undertake during the new year.

While the output of the Yukon Territory has aggregated one hundred and fifty millions during the eleven years of active mining operation, it is hoped that more than this sum will be produced in the next ten years. Not only placer, but quartz and copper are contributing to the mineral output of the Territory.

New methods of mining are coming to the fore as a result of experience and the application of energy and industry. Canada has reaped millions in trade from this territory, and will reap millions more during the next decade. The older provinces well can afford to encourage this coming new province for selfish, if not for more lofty, purposes. While the old time individual miner is being crowded to the outskirts in this territory and is working ground not altogether so rich as was the rule in the past, his invaluable efforts of empire pioneering are unrelaxed, and the heaven will have its effect.

At the same time that the individual is striving to open new placer and new quartz fields, an element new to this territory is taking hold with greater effort than even dreamed of in early days. Capital has come to the aid of the prospector, and many low grade placer and mineral propositions are being brought into the working list.

While quartz enterprises are in their infancy, it is to be chronicled with much significance that this country of scarcely more than ten years' standing in the mining world has some of the finest quartz fields open, and a not insignificant sum invested in working machinery. In the Whitehorse end many tons of copper are being mined and shipped to the smelters daily, and the time rapidly is approaching when this output will be greatly multiplied. The White Pass Railway began during 1908 the construction of a branch line of railway into these copper fields, and intends to push construction again, probably as soon as the snow disappears. It is predicted that this line in time may cross to the Kluane and White River

copper fields, both of which have engaged the serious attention of copper prospectors for several seasons.

The southern end of Yukon also is to be credited with the installation of the first concentrator in the entire Yukon basin from St. Michale to the head. The concentrator is at Conrad, and is working daily in treatment of ores from the Conrad mines, which are controlled and being worked by a syndicate represented by Colonel Conrad. The capacity of the concentrator, the Colonel recently announced, is to be doubled by next season.

The Conrad properties are but a few of the many now held in the Conrad and White Horse districts, and splendid leads are being developed from that part of the country.

In every section of the Yukon as one progresses from the southern end northward the same hopeful spirit prevails among the prospectors, and mineralized properties are being investigated as rapidly as the prospector can carry on the double work of progress and self-sustenance.

Near Dawson the quartz properties have so taken a hold on the faith of the people that scarcely an individual in the country has not awakened to the possibilities, and nearly every other man, whether he be a dweller in city or country, has an interest in hard rock properties.

Although none of the quartz properties near Dawson have progressed like these of the southern end to the condition of production and shipping of ore, some have extensive work under way, and have shipped sample lots. Never was there greater activity in the staking of quartz in the Klondike proper, that is within 50 miles of Dawson, than during the year just ended, and perhaps never were so many people of the country reinvesting their northern earnings in quartz claims in this district as just now.

One of the most promising quartz localities is that of the dome between Dominion Creek and the Hunker-Bonanza side. Nearly the whole ridge is taken, and leads have been followed in many directions along the various side streams. Owners are organizing to develop, and it is expected that the year of 1909 will decide the fate of many claims. From samples of ore obtained from surface leads and from shafts and tunnels of 20 to 50 feet deep, there should be a vast quantity of unusually high-grade gold-bearing quartz in workable quantities in the many miles of the famous old ridge. The most extensive work on these properties so far undertaken is by the Davison people, who are running a tunnel from the 400 ft. level through the mountain. Work has been under way with day and night shifts for some time, and it is expected that mechanical drills will be employed before long.

In the Twelvemile and Lepine districts, along Hunker and Bonanza, particularly at the head of these two streams, and to some extent at the head of Eldorado, the quartz enthusiasts are working. Tunnels are being run in every direction. Certain Dawson people are opening the famous Lone Star again, and declare they are sure of success.

On Williams Creek, Merritt Creek and other streams in the area between Dawson and White Horse much energy is being expended on the opening of copper, and splendid samples have been received in Dawson.

One of the most promising propositions ever tackled in the north is the conglomerate of the Indian River district. Several faithful hard-rock miners have been working there for years, feeling sure they can demonstrate the wealth of the locality. The property is simply a great gravel deposit bound together with a hardened cement, through which is scattered gold. It is conceded that the property is not of high grade, but it is so readily accessible and so vast and unbroken in quantity that it is declared to be one of the safest and surest hard-rock propositions. The Mackinnon Brothers, who have mined on the Rand, declare this a similar proposition, and have demonstrated the richness of the property. Capital already is inter-

ested in various Indian River conglomerates to the extent of testing, and it may be that 1909 will see important results.

From northward of Dawson, even to the Arctic coast, comes news of the ever busy prospector looking industriously for new mines, and eyes are being kept open for quartz as well as placer. The Firth River, in Yukon Territory, flowing into the Arctic Ocean, may be the scene of the next big placer strike. Jim Smith and others are prospecting there, and a number of reports of gold being found on the stream and in the vicinity are drifting back from time to time.

Up the Pelly River, another great valley district of the North, many streams have been proven the last year to carry gold, and prospectors have brought down pannings which, when shown in Dawson, have excited the greatest interest, and stimulated afresh the longing to locate the paystreak.

Bob Henderson, discoverer of the first gold in the tributaries of the Klondike River, has spent the last two summers on the Pelly, and has brought down many small vials carrying samples of gold he secured there on various streams. Henderson intends to make the Pelly his future home, and he declares that it is only a matter of time until the Pelly shows a gold field as productive as the Klondike.

The year of 1908 has seen its greatest operations in the neighborhood of Dawson in the way of hydraulic and dredge mining.

No less than 18 large dredges are at work in the territory, and three to six more are expected to arrive this year. The type of dredges now being brought here cost laid down and ready for operation not less than \$150,000. The gravels which they are working are, on the whole, lower grade than those operated by the old-time individual miners, but are yielding splendid returns.

Some of the dredges ran into such rich pay that they paid for themselves in a half season or less, and it is said that the Bear Creek dredge, on the Klondike River, paid for itself almost within the first month it was operated, and that during the summer of 1908 it did almost as well as in its initial summer. That dredge has handled more gravel than any other in the territory, and has travelled more from its original position. Being in the open river of the Klondike, it worked this fall until November 9, when it shut down only because its fuel supply was exhausted. It was thought that the dredge might have a run until Christmas had it not been for the want of wood.

The dredges on the Guggenheim properties on Bonanza and Hunker worked steadily through the season, driven by electricity from the power station on the Twelvemile River, 30 miles distant. These machines are among the finest types of dredges in the world, and their tailing piles are like mountains. It is understood that the returns have been very satisfactory, particularly on the Anderson concession, and at 90 below, where pay yielding three dollars and more to the yard is said to have been secured on both these properties. One stretch on the ground at the mouth of Bonanza is understood to have run even better than that.

All the dredge companies are progressing, and are planning to expand, a most favorable indication.

The Guggenheims have eight dredges and three electrical conveyors, which are dredges without the barges, and are moved instead on rolling giant steel frames, and operate so that they afford the great advantage of cleaning every inch of bedrock, and getting much gold not obtained by the dredges.

The Bonanza Basin Company has one dredge, which is one of the most fortunate in the country, and works almost in the very townsite of Dawson.

Other rich dredging properties are: Walker's Fork, where Russel King's companies have two fine gold ships; the lower Fortymile, where the Consolidated Gold Dredging Company of Alaska has two dredges making most successful records; the Stewart River Company, recently organized, which has one

dredge ordered, and may order others for this year; and the Yukon Basin Company, headed by former Governor Ogilvie, with one dredge, and holding 120 miles or more of submerged ground, an area greater than that of the Guggenheim holdings in Yukon. The Ogilvie people have one dredge ordered for this year, and may make it three. Dan Matheson, superintendent of the company, leaves in a few days for the outside to confer in regard to the work.

The Consolidated Company in the Fortymile district will have new machines this year, and others may swell the number.

The dredging success has turned many other eyes this way, and numerous rich streams in the Klondike and Fortymile districts, and in the Circle, Fairbanks, and other Yukon fields, are being investigated by agents of various investors.

Several large power schemes are being formulated for the various properties. The rich adjacent coal fields, as well as the splendid water streams, are being brought into the power service, and millions in the aggregate will be expended in getting their energy enlisted.

The hydraulic properties of the many rich streams adjacent to Dawson have been in greatest prominence during the last year. Thirty or forty concerns have hydraulic plants within 50 miles of Dawson, and are working so inexpensively that they are getting profit from a vast area that the old-time miner could

not work at an advantage. All these advances mean increased Yukon output.

The Guggenheims alone have invested \$12,000,000 near Dawson, and will invest several millions more.

The great number of men on ditch, dredge, hydraulic and other mining work, aside from the private enterprises near Dawson, during the summer of 1908, meant the expenditure of millions for wages and supplies. Most of the miners and other employees were induced to remain in the territory for the winter, and the fundamental work of prospecting and opening new properties is thus greatly facilitated.

The extensive work of installation of new dredging and hydraulic plants, including 12 miles of ditch the Guggenheims will build up Bonanza this summer, will mean the distribution of much more money, and ensures grubstakes for an army of prospectors for the next year. By the year 1910, or a year later, the Guggenheims expect to have their great properties working in every portion.

All told, Yukon Territory never was at a more promising stage, and on a more permanent basis. It has begun to produce nearly all the vegetables needed within its borders, and thus will keep a vast sum of money at home.

Reinvestment is becoming more common, capital is headed this way together with labor, and the destiny of the North is assured.

## GENERAL MINING NEWS.

### ONTARIO.

**Cobalt.**—The west drift of the Cobalt Lake mine is out under the lake several hundred feet from the main shaft, at a depth of 154 feet, and is within a very short distance of the boundary of the station grounds.

La Rose is beginning to realize to advantage the large amount of underground development already done, and during the last few months has been blocking out ore much more rapidly by reason of being able to work machines in so many drifts at once on its numerous veins.

The shaft on the Pontiac has been sunk on the vein to a depth of over 25 feet, and 20 sacks of first-class ore have been taken out. The company has installed a small plant, which is now in operation, and night and day shifts are kept at work.

The Crown Reserve has shipped 100 tons of high-grade ore to Beer, Sondheimer & Co., Hamburg. This is the biggest shipment ever sent to Germany, is said to be the most valuable consignment of Cobalt ore ever sent out of Canada for treatment.

The City of Cobalt main shaft is now down 225 feet, and is getting argentite from a vein 8 inches in width. It is said to be the finest argentite seen in camp, and will go about 10,000 ounces of silver to the ton.

While no ore has as yet been shipped from the Ottise, a quantity of valuable ore has been sacked up and stored in the ore-house. This was taken from No. 1 vein in course of development.

The Silver Cross is now working at the 70-foot level on No. 2 vein, where cobalt ore is being bagged.

The Gifford is working night and day shifts, and the main shaft is now down 60 feet and timbered all the way.

The main shaft at the Badger is down 223 feet. It is an incline shaft sunk on the vein for its entire depth. It is a cobalt, calcite and silver vein carrying native silver. The first level is at a depth of 100 feet, and drifting has been done east and west for 224 feet. Stations have been cut at the 200-foot level, and drifting is to be started. The new plant consists of a 12-drill Sullivan compressor and two 100 h.p. boilers, electrical plant, etc.

**St. Catharines.**—Natural gas was struck here at a depth of 200 feet by men boring for pure water on the Kinleith Paper Company's property on the old canal bank. This is the first strike of natural gas at or near St. Catharines. The boring will continue.

### ALBERTA.

**Lethbridge.**—The Scranton Coal Mining Co. and the Central Mining Co. have consolidated under the name of the Scranton Coal Company. This company controls 1,500 acres of coal lands, and is now producing at the rate of 500 tons per day, and expects to raise the output from 800 to 1,000 tons per day within a month.

**Frank.**—The C. A. C. & C. Co. are at work developing the coal deposits half way between Turtle and Goat Mountains. Four years ago a shaft was sunk some 300 feet. A powerhouse was built, but was abandoned. Now the company are pumping out the shaft and use it as an air shaft. They intend sinking another shaft to strike the vein and operate it as a new development. The company have about 150 men at work at present.

### BRITISH COLUMBIA.

**Rossland.**—W. A. Carlyle, consulting engineer of the Le Roi Co., is engaged in making an examination of the workings for the purpose of outlining a further plan of development. The explorations in the Le Roi continue on the 1,750-foot level for the purpose of locating the ore shoot, which is now being operated satisfactorily on the 1,650-foot level.

The Rossland Miner," in answer to a correspondent inquiring concerning the Big Four mines and an emergent call issued by the Big Four management for more money, has the following to say: "So far as operations of this company are concerned, no work is now in progress on its properties in this camp, nor has there been any that we know of for several years past. We have no means of knowing how much money has been collected by the management of the Big Four in the shape of assessments or from the sale of shares, but is a certainty that the amount expended on the properties for the past five years has been

small." In the opinion of the "Miner" the Big Four Company is a "wildcat" concern, pure and simple, and the constant raising of funds by means of assessments and so-called "emergency calls" is nothing less than fraudulent.

**Trail.**—Mr. W. H. Aldridge, manager of the Trail smelter, which is owned by the Canadian Pacific Railway, regarding the company's mineral and smelting properties in the West announced that the company has made a long contract for the whole of the Le Roi No. 2 output at Rossland, something like 100 tons of ore per day, for treatment at the smelter. As this mine ships the highest grade ore in the Rossland camp and has paid dividends for a long period regularly, it is felt that a good stroke of business has been done.

"The company is now treating 40,000 tons of ore per month at the Trail smelter," Mr. Aldridge says, "and the gross value of the monthly output is over \$400,000, \$4,800,000 worth per annum, of which 40 per cent. is gold, 22 per cent. silver and lead each, and 16 per cent. copper.

"The ores are being supplied largely from the company's properties which are located in the Boundary, Rossland, East Kootenay and Slocan districts. The company also occasionally purchases copper ores from Idaho.

"So far as the general condition of the mining industry in the Canadian West is concerned, Mr. Aldridge says that notwithstanding the present low price of copper, lead and silver, the output of the mines continues large, and the general result under the circumstances is fairly satisfactory.

"The coal mines in British Columbia and Alberta are working at their full capacity, and everything indicates that the consumption will continue large.

"The C. P. R., which began the development of its own coal areas not long ago, has now a large installation, including steel pipe and coke ovens, at Hosmer, and are increasing their output from the property slowly.

"Most gratifying results are being obtained from the new method that has been adopted at the Bankhead mine in Alberta, where hard coal dust, which formerly went to waste, is being turned into an exceedingly profitable output. The consumption of soft coal dust for steam purposes has long been a practical proposition, but hard coal dust long defied manipulation. Five hundred tons per day of briquettes which are made from hard coal dust are now being produced and used for locomotives as well as domestic purposes."

**Phoenix.**—Granby officials estimate an increase in copper output during 1909 of 25 to 30 per cent. The enlargement of the furnaces will be finished by June, and will give a smelting capacity of from 4,500 to 5,000 tons per day as against 3,200 at present.

The B. C. Copper Company's production for the calendar year 1908 amounted to 6,731,351 pounds. This is for the last

seven months only, as the mines were closed down during the first five months of the year.

A 5-foot ledge of copper ore has been cross-cut on the Woodburn property of the Phoenix Mining, Smelting & Development Co. The tunnel has now reached a distance of 450 feet.

**Nelson.**—James McMartin has taken over the bond on the Kootenay Belle and Mother Lode groups in Sheep Creek, and a new era is expected in the development of that camp.

A company with the title of the Osoyoos Mining Co., Ltd., has been formed to take over a group of coal properties near Princeton in the Similkameen Valley. The company owns about 1,900 acres of land situated between the Similkameen and Tulameen Rivers. Considerable drilling has been done, and one hole bored to a depth of 863 feet passed through 17 seams with an aggregate thickness of 50 feet 6 inches. It is expected that the V., V. & E. Railroad will, in the near future, pass alongside the mines.

**Vancouver.**—The reorganization committee of the Dominion Copper Company has formulated a reorganization plan based on the committee's opinion that the large amount of new capital required to develop the property and the small profits from the low grade ore may make it advisable to sell the property. The plan of reorganization is for the committee to purchase the property at foreclosure sale and transfer it to the new Dominion Copper Company, which will issue the following securities: Five hundred thousand dollars at 6 per cent. ten year income bonds convertible into stock at par, \$5 per share; 250,000 shares of common stock of par value of \$5 per share. Present bond holders will take new stock for their bonds on the basis of 210 shares of new stock for each \$1,000 bond. This will absorb 168,000 shares of new stock. Creditors will receive 20,000 shares for each \$100,000. Present stockholders subscribing at par for the new bonds on the basis of 100 of bonds for each \$1,000 of present shares will receive a bonus of 10 shares of new stock for each 100 shares of the present stock. Underwriters will receive 12,000 shares of the new stock. If the committee deems it advisable to sell the property it is restricted to a minimum price of \$800,000.

**Nanaimo.**—The South Wellington Coal Mines Co. is making steady progress. One hundred men are at work in the mines and as many more are engaged in construction about the property. At present several hundred tons are being mined weekly and this output will be greatly increased as the mine is opened.

**Barkerville.**—The Canadian Creek Mining Company has purchased the machinery on the derelict Seymour Baker dredge at Quesnel. This machinery will be installed on Slough Creek, where prospect shafts have been sunk and satisfactory results obtained.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

A colliery disaster occurred at West Stanley, about 12 miles from Newcastle-on-Tyne, on Feb. 16th. Two explosions were followed by a fire, which prevented any attempt at rescue for some time. Finally a rescue party sent down the following day succeeded in bringing up 37 men alive. About 110 lives were lost.

The first colliery rescue station in South Wales was opened at Aberaman on Jan. 23rd.

The tin alluvial deposits of Cornwall, which have not been worked for some time under the impression that they were exhausted, are now receiving attention. Operations recently begun on Goss and Tregoss moors in Central Cornwall have been successful in extracting tin in paying quantities.

The Minister of Labor will introduce a measure in the Legislature dealing with miners' pensions. The project under consideration provides for a minimum pension of 360 francs per annum at 60 years of age. The funds will be provided by contributions from employers and workmen supplemented by Government subsidies.

### GERMANY.

The production of coal in Germany for 1908 was 148,621,201 tons, an increase of 5,398,315 tons as compared with the output of 1907. The output of coke for the year fell off from 21,938,038 tons to 21,174,956 tons.

The annual congress of German miners opened at Berlin on Feb. 1st about 300 delegates being in attendance. A resolution

was unanimously adopted demanding Imperial legislation for the supervision of collieries by independent inspectors, representatives of the mines having no connection with colliery owners.

#### RUSSIA.

On the western portion of the Amur Railway, now under construction, gold has been discovered in such quantities that the laborers are quitting their work to search for gold and have been largely successful. The Government proposes to station troops along the line to protect the gold deposits.

Extensive deposits of wolframite and precious stones have been found on the Shirloff Hill, near Borsya Station, in the neighborhood of Manchuria.

#### AUSTRIA.

A deposit of coal has been discovered near Grain-an-der-Donau, Lower Austria.

The Nordbahn Railway has erected 144 Hoffmann coke ovens in four batteries at Vienna.

#### ITALY.

The British Consul at Palermo reports that the Sicilian sulphur trade has not been affected in any way by the recent earthquake.

#### AUSTRALASIA.

The Broken Hill labor dispute is being adjudicated by the Federal Arbitration Court at Melbourne. Two men have been sentenced to six months' imprisonment each for assaulting officials of the Broken Hill Proprietary mine.

The finding of a gold nugget of 81½ oz. at Talga Talga, Western Australia at a depth of 9 feet is reported.

The mineral production of New South Wales for 1908 is valued at £8,609,607. The gold output was 224,792 oz. valued at £954,854. The yield of coal was a record one, being 9,147,025 tons valued at £3,353,093, the production having doubled during the last ten years.

#### SOUTH AFRICA.

A large company is being found in London for the purpose of establishing electrical works in the Rand on an extensive scale. The capital will be in the neighborhood of £2,000,000. The company intends to supply power to the mines.

Several syndicates found for the purpose of working the mica deposits in the Zoutpansberg district have proved failures owing to the heavy expenses curtailed by lack of railway facilities, and the insufficient working capital available. Another enterprise of this character has been undertaken to work claims covering 334 acres on the Oliphant River.

The gold output of the Transvaal for 1908 was 7,052,617 oz. valued at £29,957,610, which constitutes a new record. The production of 1907 was 6,451,384 oz. of the value of £27,403,738.

#### UNITED STATES.

Heavy snow and rain storms on the Pacific Coast have caused considerable interruption to mining and smelting operations. Many plants were obliged to close down.

The Phelps-Dodge copper smelting companies have filed complaints with the Interstate Commerce Commission at Washington against the Baltimore & Ohio and other railroads, alleging discrimination in transportation rates for coke shipped to smelters in Texas and Arizona.

The new 87-ft. blast furnace of the Washoe smelter in Deer Lodge Co., Montana, claimed to be the largest in operation in the world, was recently blown in. The two other blast furnaces are 51 ft. in length. The smelter is producing from 300 to 400 tons of copper daily.

The new electrolytic plant of the Elkhorn Electro-Metals Co., Jefferson County, Montana, was put in operation early in February.

The United States Steel Corporation has decided to introduce the Heroult electric furnace and steel process. One 15-ton Heroult furnace will be built at the South Chicago works of the Illinois Steel Co. and one of the same capacity at the Washburn & Moon plant at Worcester, Mass., in connection with the American Steel & Wire Co.

#### MEXICO.

A revival of the zinc industry of Chihuahua is noted as a result of an American decision placing carbonate in the calamine class as duty free for importation into the United States. Several large American firms have closed contracts with zinc producers and a number of mines are under option.

The old Promontorio silver mine in the Cusihiuriachie camp, Chihuahua, has been acquired by the Potter-Palmer estate, of Chicago, for \$125,000.

## COMPANY NOTES.

#### NOVA SCOTIA STEEL CO.

Nova Scotia Steel Co. will not resume dividends at present on the common stock. The profits of the company for the year 1908 were \$734,701.53, as compared with \$944,790.66 for the year 1907. The amount at the credit of profit and loss account on January 1st, 1907, was \$1,202,604.39, which, with profits for the year 1908, make a total of \$1,937,305.92 to credit of profit and loss account on December 31, 1908. Out of this sum \$76,745.50 has been transferred to the credit of special reserve funds, of which \$50,000 is the usual allowance for depreciations, and \$13,745.50 is for blast furnace renewals (being 25 cents a ton on the output of pig iron during the year), and \$13,000 is for depreciation in the value of ships. The balance to the credit of the special reserve accounts is now \$857,225.93.

The balance carried forward to the credit of profit and loss is \$1,219,221.07, as compared with \$1,202,604.39 on the 1st of

January, 1908. The sum of \$321,735.08 has been expended during the year on capital account.

#### DIVIDEND PASSED.

The directors of the Silver Queen Company, at the annual meeting recently, under the advice of President Culver, decided to pass the dividend for the current quarter.

The company has hitherto paid 12 per cent. in 3 per cent quarterly dividends, and on two occasions bonuses were added.

F. L. Culver, the president of the company, discussing the action of the directors, said: "It was entirely on my advice that the directors decided not to pay the usual dividend. We have plenty of money on hand, but we have run into a lean streak, such as most mines experience in their development. In the interest of the shareholders I thought it wise to hold the money we have in order to keep up the development until we got into good paying ore again."

Mr. Culver thought that with active work the mine would again be put into a condition entirely satisfactory to the shareholders.

#### RIGHT-OF-WAY ANNUAL MEETING.

The directors of the Right of Way Mining Company announced at the annual meeting that the company is to be placed on a 6 per cent. quarterly dividend basis, with whatever bonus in addition may be considered advisable.

It was decided that for the quarter ending March 31 of this year a 6 per cent. dividend along with a 9 per cent. bonus, will be paid. The shareholders of the company, regarded as one of the luckiest of the many Cobalts, listened to a statement of the year's operations, showing that the value of the output was \$218,000 and the portion paid to the Temiskaming & Northern Ontario Railway Commission totalled \$49,000.

After all the expenses incidental to development, etc., were paid, there was a net balance of \$83,000, out of which two 7 per cent. dividends were paid. The balance, along with that carried from the previous year, leaves \$154,000 to the credit of profit and loss. Included in that is the amount of the La Rose judgment.

The board of directors elected were as follows: Messrs. Geo. Goodwin, T. A. Beament, A. W. Fraser, K.C., Dr. J. F. Kidd, all of Ottawa, and J. G. Turriff, M.P.

#### BIG SIX COMPANY DIVIDEND.

It is reported that the Big Six Silver Cobalt Mines, Ltd., have sold four of their mining claims. The company have authorized the payment of a dividend from the proceeds of this sale. They have retained ten properties, which they propose to develop, including one at Miller Lake and one adjoining that of the Mother Lode Mining Co. at Elk Lake. On the Elk Lake claim a shaft has already been sunk 75 feet on an eight-inch calcite vein, and it is intended to continue this shaft to the 150 foot level.

#### BUFFALO MINES BONUS.

The Buffalo Mines, Ltd., have declared an extra dividend of 1 per cent., payable March 1, 1909, to stockholders of record Feb. 20, 1909.

La Rose net earnings for January were at the rate of 19 per cent. per annum, the result being obtained from ore averaging considerably less than \$300 per ton, and very little stoping being done.

In these net figures allowance also is made for all expenditure on affiliated properties, which is, therefore, being charged against the earnings of the one claim.

#### TEMISKAMING MINING CO.

The annual meeting of the Temiskaming Mining Co. was held on Feb. 20th. The financial statement presented was highly satisfactory and met with the unanimous approval of the shareholders present.

There was no decision in regard to the dividend for the current quarter, and it is supposed that this will be at the regular rate of 24 per cent. per annum. The quarterly dividend will be made on March 6. The election of directors resulted as follows: President, B. E. Cartwright; R. T. Shillington; vice-president; Alex. Faskin, secretary-treasurer, and J. L. Wheeler and R. A. Cartwright.

#### NIPISSING'S CASH ASSETS.

On February 1st Nipissing had in its treasury, after the payment of \$300,000 dividends, \$755,000 in cash. Before the time arrives for the next dividend this item should have again reached the \$1,000,000 mark.

#### McKINLEY-DARRAGH ANNUAL MEETING.

At the annual meeting of shareholders of the McKinley-Darragh-Savage mines, held here, a financial statement for the year was presented, showing cash in hand Jan. 1, 1908, of \$111,448.72, receipts from sales of ore \$345,792.01, interest \$2,287.65, total \$459,528.38. Of this amount additions to plant took \$46,231.39, operation and development \$139,921.66, dividend \$202,309.71, directors' fees \$150, salaries \$13,026.90, and other expenses \$11,276.02, leaving cash on hand at the end of 1908 of \$46,612.70. It will be noticed that no mention is made in the above figures of the amount of ore in transit, or due from the smelters to the mine. It is understood a large payment was made by the smelters to the McKinley-Darragh Company, after the above figures were computed.

## STATISTICS AND RETURNS.

#### BRITISH COLUMBIA ORE SHIPMENTS.

The following are the shipments for the week ending Feb. 6th, 1909 and year to date in tons.

##### Boundary Shipments.

|                       |        |         |
|-----------------------|--------|---------|
| Granby . . . . .      | 21,941 | 89,115  |
| Mother Lode . . . . . | 9,744  | 39,564  |
| Boundary . . . . .    | 19     | 19      |
| Snowshoe . . . . .    | 4,655  | 13,081  |
| Other mines . . . . . | .....  | 1,071   |
| Total . . . . .       | 36,359 | 142,850 |

##### Rossland Shipments.

|                                |       |        |
|--------------------------------|-------|--------|
| Le Roi No. 2 . . . . .         | 1,095 | 2,487  |
| Le Roi No. 2, milled . . . . . | 260   | 1,140  |
| Centre Star . . . . .          | 3,764 | 9,315  |
| Other mines . . . . .          | ..... | 3,054  |
| Total . . . . .                | 5,119 | 15,996 |

#### Slocan-Kootenay Shipments.

Total . . . . . 3,091 15,819  
The total shipments for the past week were 44,560 tons, and for the year to date 271,297 tons.

##### Granby Smelter Receipts.

##### Grand Forks, B.C.

|                  |        |        |
|------------------|--------|--------|
| Granby . . . . . | 21,941 | 89,115 |
|------------------|--------|--------|

##### B. C. Copper Co.'s Receipts.

##### Greenwood, B.C.

|                       |        |        |
|-----------------------|--------|--------|
| Mother Lode . . . . . | 9,744  | 39,564 |
| Snowshoe . . . . .    | 2,630  | 3,850  |
| Other mines . . . . . | .....  | 1,050  |
| Total . . . . .       | 12,374 | 44,464 |

##### Consolidated Co.'s Receipts.

##### Trail, B.C.

|                 |       |        |
|-----------------|-------|--------|
| Total . . . . . | 7,399 | 26,141 |
|-----------------|-------|--------|

**Le Roi Smelter Receipts.****Northport, Wash.**

|                   |     |       |
|-------------------|-----|-------|
| Other mines ..... | 536 | 4,582 |
|-------------------|-----|-------|

The total Smelter receipts from the various mines for the past week were 30,053 tons, and for the year to date 114,751 tons.

The following are the shipments for the week ending Feb. 13th, 1909 and year to date in tons:—

**Boundary Shipments.**

|                   |        |         |
|-------------------|--------|---------|
| Granby .....      | 25,569 | 114,684 |
| Mother Lode ..... | 16,360 | 55,924  |
| Snowshoe .....    | 4,152  | 5,230   |
| Oro Denoro .....  | 60     | 1,650   |
| Other mines ..... |        | 221     |

|             |        |         |
|-------------|--------|---------|
| Total ..... | 46,141 | 177,512 |
|-------------|--------|---------|

**Rossland Shipments.**

|                            |       |        |
|----------------------------|-------|--------|
| Le Roi No. 2 .....         | 1,107 | 3,594  |
| Le Roi No. 2, milled ..... | 260   | 1,300  |
| Centre Star .....          | 2,307 | 11,722 |
| Le Roi .....               | 1,351 | 4,313  |
| Other mines .....          |       | 92     |

|             |       |        |

**Le Roi Smelter Receipts.****Northport, Wash.**

|                   |       |       |
|-------------------|-------|-------|
| Le Roi .....      | 1,351 | 4,313 |
| Other mines ..... | 160   | 1,780 |

|             |       |       |
|-------------|-------|-------|
| Total ..... | 1,511 | 6,093 |
|-------------|-------|-------|

The total smelter receipts from the various mines for the past week were 52,675 tons, and for the year to date 291,548 tons.

**CROW'S NEST PASS COAL OUTPUT.**

The output for the collieries of the Crow's Nest Pass Coal Company for the week ended Feb. 20th was 16,488 tons, or a

daily average of 2,748 tons. For the corresponding week of last year the output was 21,205 tons, a daily average of 3,534 tons.

**COBALT ORE SHIPMENTS.**

Following are the weekly shipments from Cobalt camp, and those from Jan. 1st, 1909, to date:—

|                                | Week ending<br>Feb. 13.<br>Ore in lbs. | Since<br>Jan. 1.<br>Ore in lbs. |
|--------------------------------|----------------------------------------|---------------------------------|
| Buffalo .....                  |                                        | 88,280                          |
| Coniagas .....                 |                                        | 271,905                         |

**MARKET REPORTS.**

Feb. 19.—Connellsville coke, f.o.b., ovens:—

Furnace coke, prompt, \$1.65 to \$1.75.

Foundry coke, prompt, \$2 to \$2.15.

**Metals.**

Feb. 19.—Tin, Straits, 28.25 cents.

Copper, prime Lake, 13.12 $\frac{1}{2}$  to 13.37 $\frac{1}{2}$  cents.

Lake, arsenical brands, 13 to 13.25 cents.

Electrolytic copper, 12.87 $\frac{1}{2}$  to 13 cents.

Copper wire, 15.25 cents.

Lead, 4.02 $\frac{1}{2}$  cents.

Spelter, 4.90 cents.

Sheet zinc, 7.50 cents.

Antimony, Cookson's, 8 cents.

Aluminium, 22 to 24 cents.

Nickel, 40 to 47 cents.

Platinum, \$22.50 to \$23.50 per ounce.

Bismuth, \$1.75 per pound.

Quicksilver, \$44.50 per 75 lb. flask.

## Mining Engineer

Who is at present opening up and testing a Copper-Gold Proposition, which is shortly to be closed down, desires to get into communication with parties requiring the services of a competent Mine Superintendent. Had extensive experience in Metalliferous Mines and Milling. Opened up and developed mine and supervised erection of the entire plant of one of the largest Free Milling Gold Mines in Canada. Can give satisfactory References and Testimonials. Correspondence solloited. Apply in first instance

"M. E.,"

# Amatite

## ROOFING

PAINTING a roof is work. Buying the paint is expense. Both are needless if your roof is Amatite.

When you finish laying Amatite, take away your ladder, pick up your hammer and knife, go away and leave the roof to take care of itself. A few years later you may go back and look at it if you care to, but it won't be necessary, and there won't be anything to do.

This is due to the fact that Amatite has a *real mineral surface*—a surface that is too strong to need protection—too durable to require painting.

If you buy one of the smooth surfaced roofings you will have to paint it every two or three years to keep it from leaking. In fact, such roofs depend on the paint almost entirely for their waterproofing qualities.

Amatite on the other hand depends for its waterproofing upon double layers of Coal Tar Pitch,—the greatest known enemy to water.

Amatite comes in rolls of 110 square feet ready to lay. No special tools are required, and anyone can lay it properly.

A Sample of Amatite will be forwarded free on request. Send for it and see how much better it is than the kind which requires painting to keep tight.

# Some Books of interest on Mining to be had from the Book Department of the Canadian Mining Journal, Toronto, Ont.

**The Copper Mines of Lake Superior.** By T. A. Rickard. An attractive volume of 165 pages, handsomely illustrated. The present work consists of a group of interesting articles in a revised and amplified form, which were originally published in the columns of The Engineering and Mining Journal during the latter part of 1904. Octavo, cloth. Price, \$1.00.

**The Chemistry of Cyanide Solutions Resulting from the Treatment of Ores.** By J. C. Clennell. Price, 2.50.

**Across the San Juan Mountains.** By T. A. Rickard. A graphic description of a picturesque ride of 400 miles on horseback through the San Juan Mountains in South-western Colorado. The work is written in vigorous and buoyant style, and the information contained therein, while appealing specifically to the geologist, prospector, and mining engineer, will also prove of great interest and enjoyment to the general reader. Small quarto, cloth, ornamental covers and profusely illustrated. Price, \$1.00.

**Ore Deposits.** A discussion republished from the Engineering and Mining Journal, containing the recent contributions on the origin of ores. By S. F. Emmons, W. H. Weed, F. L. Ransome, C. R. Van Hise, T. A. Rickard, and C. W. Purington. The matter originally published has been revised and amplified. A review of the subject by the Editor of the Engineering and Mining Journal is added. It is an up-to-date discussion of a subject which is of great interest to mining men. The book contains 100 pages. Cloth. \$1.00.

**Mineral Resources of Canada.** An illustrated handbook giving a brief outline of the economic minerals of Canada, and sketching the mineral resources of each province. The book contains 140 pages, 32 color engravings of the most important minerals. The latest mineral Resource Map of the Dominion, showing the chief mineral deposits, is also included. No such work has been attempted in Canada before. This volume should be in the hands of every one interested in the mining industry. The price of this volume is extremely moderate. \$1.00.

**Minerals and How They Occur.** By Willet G. Miller, Provincial Geologist, a volume of 250 pages, illustrated. This book is especially adapted to the prospector for minerals, as he must have a knowledge of mineralogy before he can properly understand the character of rocks and the effects which are produced on them by atmospheric and other agencies. If you are a prospector this is the work for you. Price, \$1.00.

**The Sampling and Estimation of Ore in a Mine.** By T. A. Rickard. Sampling and mine valuation are eminently practical subjects, and in this work they are handled in detail by engineers and experts of the first rank, who have had world-wide experience in these matters. To students, mine directors, mining engineers, mine investors, and engineers generally, this volume will be found extremely useful. Octavo cloth, profusely illustrated. Price, \$2.00.

**Rocks and Rock Minerals.** By L. V. Pirsson, Professor of Geology in Yale University, 414 pages, 74 figures, 36 full-page half-tone plates. Not all mining men have an intimate knowledge of petrology, or the science of rocks. Even those who have had the advantage of a college course find that only a small residue of what they learned adheres to them. Most text-books on the subjects are cast into forms that repel the lay reader. Hence it is not easy for the beginner to acquire the rudiments of the science. "Rocks and Rock Minerals" is an attempt to present the outlines of petrology in such a way as to give an intelligent idea of the subject to readers quite unacquainted with the microscopic standpoint. Rocks and rock minerals are dealt with entirely from a megascopic, or practical outdoors, point of view. The book before us attains the desired object of giving the reader a knowledge of rocks and rock minerals without recourse to the microscope. It is a very fair introduction to the study of geology generally. Part III., in which igneous, stratified, and metamorphic rocks are described, is an excellent treatise in itself. Simplicity is the keynote of the book. Cloth. Price, \$2.50 net.

**A History of Cobalt.** During the summer of 1907 the Canadian Mining Journal published a beautiful illustrated souvenir volume. Included in this volume is a history of the early days of Cobalt. An excellent map of the district accompanies the book. Price, \$1.00.

**The Electric Furnace.** By Alfred Stansfield, D.Sc., A.R.S.M., Professor of Metallurgy, McGill University. There has long been need of a good book on electric furnaces. The increased importance of the subject and the great value to metallurgy makes this book most timely. 211 pages (illustrated) 6 x 9 inches. Price, \$2.00.

**Simple Mine Accounting.** By David Wallace. A neat compact description of the simple methods of keeping mine accounts. Mr. Wallace is an expert mine accountant and in this book he outlines briefly and simply the kind of accounts and records which a small mine should keep. 64 pages, 6 x 9 inches, with bookkeeping forms. Price, \$1.00.

*When answering Advertisements please mention THE CANADIAN MINING JOURNAL.*

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## THE OFFICIAL MINING DIRECTORY OF MEXICO. 1908-1909

CALLE DEL ELISEO, 37, MEXICO, D. F.

EDITORS: JOHN R. SOUTHWORTH, F.R.C.S. and PERCY G. HOLMES.

"The Official Mining Directory of Mexico" is the 10th volume of the series of works, devoted to the propagation of knowledge concerning the resources of Mexico, which has been issued from these offices under the authorization of the Mexican Government, each copy being duly impressed with the Federal Seal of the United States of Mexico.

The contents of the work comprise:

Alphabetically listed descriptions of over 1,500 Mining companies operating over 7,000 mining properties in Mexico. Only such companies as employ more than 20 men, or use power other than animal power, are listed.

The data given, in respect to these companies, is exemplified in the specimen shown on this sheet. It includes name of company, home office address, mine office address, president, secretary, treasurer, directors, manager, superintendent, subordinate staff, where and when incorporated, capitalization, issued stock, par value of shares, additional financial data, names of mines, number of claims, product, description of ore, description of geological formation, kind of power used, number of horsepower used, description of mine workings, capacity of treatment plant, cyanide plant, smelter, etc., number and weight of stamps, number of grinding mills, number of tube mills, number of concentrators, number of men employed, contemplated improvements, general remarks.

The volume is illustrated by over 200 photographs and maps, showing the leading mines, mills, smelters, and camps in the Republic.

Tables of utility to mining men, shippers and investors are given.

A Spanish-English glossary of Mining Terms makes the translation of letters from Mexican miners possible, where a dictionary would be valueless.

Preliminary to the actual directory, there are special articles, written by competent Mexican and foreign authorities, on:

"The History of Mining in Mexico."

"Number and Geographical Distribution of Mines in Mexico."

"Foreign Investments in Mexican Mining Securities."

"Progress of the Metallurgy of Gold and Silver in Mexico."

"The Mexican Mining Chamber."

"The Mexican Mining Laws."

"The International Bureau of American Republics."

The edition presented to your notice is in English, and contains 280 pages, measuring 13 inches by 10 inches, bound in chocolate colored cloth, with the title in gold lettering on side and back. Type and paper are of the finest quality. Price, \$5.00, U.S. Coy., £1 1s. 0d. stg., M22., \$10.00, Mex. Coy., Frs. 25. postpaid.

Copies of this excellent work may be had from the Book Department of Canadian Mining Journal, Toronto

# Ontario's Mining Lands

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

## Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants **PROSPECTING LICENSES** for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is \$5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only \$2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, \$10.00 per acre, and on lands situate less than 20 miles from such a railway, \$20.00 per acre:

Superficial products and building materials are sold \$2 and \$4 an acre according to the distance from rail road.

**MINING CONCESSIONS** are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed

lands; work must be bona fide begun within two years and \$500.00 spent for each 100 acre concession.

**MINING LICENSES**, giving the right to work the mine and dispose of its products, are granted on payment of a fee of \$10.00 and a rent of \$1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts.

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with **MR. MILTON L. HERSEY**, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

**The Hon. Minister of Colonization, Mines and Fisheries**  
**Parliament Buildings, Quebec.**

## BRITISH COLUMBIA

## The Mineral Province of Canada

has produced to the end of 1906, \$68,721,103 of Placer Gold; \$41,015,697 of Lode Gold, \$25,586,008 of Silver; \$17,625,739 of Lead; \$35,546,578 of Copper; \$79,334,798 of Coal and Coke; and \$5,813,799 of Other Minerals; or a total of **\$273,643,722**. The Mineral Production of the Province for 1906 was

**\$24,980,546**

The Tonnage of Ore mined in 1906 was 1,963,872 tons. The Gold Production in 1906 was \$5,579,039 the Lead Output 52,408,217 lb., and the Copper 42,990,488 lb.

Lode Mining has only been in progress for about 14 years, and not 20 per cent. of the mineral land has been even prospected; 300,000 square miles of unexplored mineral-bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than any other Province in the Dominion, or than any Colony of the British Empire.

Mineral Locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full Information, together with Mining Reports and Maps, may be obtained by addressing

**HON. MINISTER OF MINES**

**Or WM. FLEET ROBERTSON, Provincial Mineralogist, VICTORIA, B.C.**

## The Crow's Nest Pass Coal Co. LIMITED

### OFFICES

**Manning Arcade, Toronto  
Fernie, British Columbia**

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 500,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Orient.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

### Our Analyses Speak for Themselves.

## DOMINION

## OF CANADA

### Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

**W. W. CORY, Deputy of the Minister of the Interior**

# Straight-Line Steam Driven Air Compressors

This Compressor was designed to meet the demands for a portable self-contained machine of simple construction, yet capable of operating efficiently with the least amount of erection, attention, or repairs. It is extensively used for mining, prospecting, and where an undeveloped property does not warrant great initial outlay, rock excavation, and other contracting work, structural steel or timber erection, pumping and, to a limited extent, in small industrial plants where circumstances will not permit of the installation of a Duplex Compressor and belt power is not available.

The Class "C" Compressor is of the double connecting rod type. It contains many distinguishing features from other machines of the same type. Comparison with straight line compressors with box beds will show that instead of the cylinders being bolted to the bed and held in place by dowel pins, with consequent shearing strains on the frame bolts and liability to get out of line, the cylinders and frame are bolted together with vertical flanged joints, thus producing a machine of the strongest possible construction. The frame is carried up to the tops of the cylinders, giving strength at the point of greatest strain, in contrast to machines of the box bed type which are cut away at that point and require tie rods between the cylinders to keep them rigid. Owing to our self-contained design very little foundation is required.

We cannot give here a full comparison of the machine with others of the same type, but our latest catalog contains a complete description. Send for a copy.

All equipment is built in the Angus Shops at Montreal from the most modern designs, embodying every improvement known to practical railroading.

**R. L. THOMPSON, District Passenger Agent, - - Toronto**

# DRY CONCENTRATION

## Absolutely Dustless The Behrend System

The Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor.

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

Write us for descriptive pamphlet. Forward sample of your ore for preliminary test.

Canadian Behrend Dry Concentrator Co. Ltd.

OFFICE, Citizen Building, OTTAWA, ONT.

Test Plant, 48½ Inspector Street, Montreal, Canada.

## Underwood

During the past four years the public has thrown away thousands upon thousands of dollars by buying imitations of the Underwood typewriter and soon afterwards exchanging them at a fraction of their cost for the original, genuine article.

No matter what machine you have used, or now use, the typewriter you will ultimately buy is the Underwood.

### THE CANADIAN MINING INSTITUTE.

The large registration of members attending the Eleventh Annual Meeting of the Canadian Mining Institute, held at Montreal on March 3, 4, and 5, may be taken as evidence of the lively interest that is evoked by that fixture. Most satisfactory also was the evident attention with which the reading and discussion of papers were followed. Moreover, the three days of convention proved all too short, and many highly valuable papers had to be omitted from the programme.

On another page there appears an account of the proceedings. It is our intention here to consider briefly a few matters bearing upon the work of the Institute.

In one respect the meeting that has just been concluded was an improvement on all preceding conventions. We refer to the fact that the proceedings were much facilitated by the presentation of papers in synoptical form. This saved time and made fuller discussion possible. Undoubtedly steps can still be taken in this direction. For instance, an inflexible time limit could be fixed for the presentation of any paper. Subjects foreign to the matter in hand should be rigidly excluded. The diversity of interests represented by the membership of the Institute appears to demand some such regulation.

The custom of attaching consecutively numbered badges to all delegates has much to recommend it. An arrangement of this kind would obviate confusion and would provide an easy means of distinguishing members from non-members.

In making these and other suggestions we do not by any means intend to imply that the last meeting was not well managed. The opposite is the case. But so rapidly is the Institute expanding that it will soon become unwieldy unless all arrangements are systematized.

By far the most important result of the Institute's deliberations was the unanimous decision to urge upon the Federal and Provincial Governments the pressing need of a Royal Commission to take up the work of simplifying and co-ordinating existing mining legislation. It was pointed out that the Federal mining law is nebulous and irregular, both in respect to its text and its administration. Moreover, all the Provinces would gain prestige, commercially and politically, if the present provincial Acts were reduced to a common basis. Work of this nature requires the continuous attention of a select body of men for not months, but years. But, as one speaker pointed out, half a million dollars spent thus would be a mere bagatelle when compared with the enormous benefits that would accrue to the mining industry, and, through it, to the common-

wealth generally. We shall have occasion to take up this subject again; but we wish to impress upon our readers and particularly upon all members of the Canadian Mining Institute, the vital need there is for the creation of this Royal Commission. Canada as a mining country has reached the parting of the ways. The mining industry should rapidly assume splendid proportions. Its progress is admittedly impeded by imperfect laws. These can be changed for the better at a cost not exceeding half of one per cent. of the wealth that is annually brought to Canadians by the industry. And the improvements that a Royal Commission could make in one or two years would, without question, cause an immediate increase in our yearly mineral output. Indeed no other course could do so much to stimulate all branches of mining. We venture the statement that the Canadian Mining Institute could not do better than to devote its whole energies to promoting this movement.

During the business sessions there was much talk of committees. Our own experience has led us to believe that committees are broken reeds. Much of the work that is assigned to them devolves upon one or two devoted persons. Canadian Mining Institute Committees are usually composed of men residing in widely separated localities. If there are to be committees then, despite all fear of sectionalism, they should be made up of persons resident in one district. But we believe also that the Secretary is competent to undertake, with the advice and encouragement of the Council, nearly all of the work now delegated to committees.

Another recommendation. It is imperative that the Secretary should visit annually every branch of the Institute. And provision should be made for this even at the risk of appropriating less money for publications. Not only will this tend to keep alive the Institute as a whole, but it will give the Secretary himself an insight into the needs and grievances of each branch.

We believe that the hints given above express opinions generally held by members of the Institute. In any case they are given solely with the desire to aid and strengthen our only national body of mining men.

And now a word of appreciation. The Montreal convention was unquestionably a success. President Miller expressed himself during one of the sessions as being highly gratified at the close attention given by the large number of members in attendance. He also spoke highly of the work of the Secretary, Mr. H. Mortimer-Lamb. For obvious reasons Dr. Miller could not refer to the manner in which the Presidential chair had been filled. But it may not be out of place to state here our opinion that the Institute was most fortunate in its choice of President. Dr. Miller has performed his duties with dignity and effectiveness.

The year 1908 was signalized by the largest and most successful summer excursion ever planned by a

technical society. We hope that the year 1909 will not be less fruitful.

Meanwhile, the Canadian Mining Journal congratulates the President, the Secretary, and the Council upon the strong position into which their combined efforts have brought the society.

### DISCOVERY AND ASSESSMENT.

Whatever divergence of opinion there may be as to the practical utility of inspection of mineral claims for discovery, there can be no question that a law that makes discovery of valuable mineral a prerequisite to securing mining territory encourages false swearing and a host of concomitant evils. Broadly speaking, the value of a mineral discovery is determined only by intelligent development. The actual value of a mineral deposit is determinable in no other way. Hence it may not be exceeding the bounds of moderation to characterize any attempt at an official declaration of the worth or worthlessness of a discovery as being arbitrary, useless, and, almost always, mischievous.

Experience in mining countries other than Canada has shown that rigid enforcement of discovery requirements is impossible. The most competent observers declare that legislation of this kind is either evaded or disregarded. Its literal application, were such a thing possible, would kill prospecting.

On the other hand, it is almost universally admitted that mining rights should carry with them specific obligations. These obligations may assume the form of rentals or of assessment work or both. Effective laws, effectively administered, perhaps need no more complicated basis than is thus provided. The proper expenditure of money and energy on mining prospects is to be encouraged.

Discovery is not enforceable. We know that its enforcement is largely a matter of discretion on the part of officials.

But when assessment work is neglected and its performance is falsely sworn to, the duty of an administration is clear.

Gowganda and its environs have been staked and re-staked by prospectors this winter. There are many actual cases where assessment work could not have been performed. There is no doubt that scores of men have, nevertheless, taken their affidavits as required by law, and have sworn that they had done the necessary amount of work, when they had done nothing more than place their stakes.

To this condition, we earnestly believe, the Ontario Government cannot remain indifferent. We submit, respectfully but none the less urgently, that inspection of assessment is a crying need. Not every claim need be inspected. If one or two offenders were caught and treated with exemplary severity, the atmosphere would be cleared. Meanwhile the new districts must suffer whatever stigma is attached to the unscrupulous methods of perjurers.

### AGRICULTURE AND MINING.

Mr. Hiram Donkin, Deputy Minister of Mines for Nova Scotia has been advocating strongly the encouragement and rehabilitation of Nova Scotia's agricultural industries. Believing that mining and agriculture march hand in hand, especially in settled countries, Mr. Donkin is urging the coal-mine operators of his Province to do everything in their power to stimulate their employees to cultivate the land.

Already in South Africa organized attempts are being made in the direction of providing a farming population for the Rand. The South African Mining Journal referred recently to "the extraordinary interest displayed by the whole community in the work of the Witwatersrand Agricultural Society, and of the South African National Union." Our contemporary also announced its belief that there has been a complete awakening to the necessity of revolutionizing the agricultural methods of the Rand.

There are many large areas in all the mining provinces of the Dominion of Canada wherein both mining and farming can be carried on profitably together to the material benefit of both of these essential industries. We have cited Nova Scotia. But there are also almost limitless tracts throughout New Brunswick, Quebec, Northern Ontario, Alberta, Saskatchewan, and British Columbia, where growing mining camps await the development that can come only with the advent of the farmer. Cultivation of the land will lower the cost of living for all classes, and from the farm the ranks of skilled labour will be recruited with able-bodied Canadians.

### ADVERTISING.

Mr. R. R. Gamey is a prominent member of the Legislative Assembly of Ontario. He is a staunch Conservative. His rise to prominence was spectacular. Formerly he was a bit of a swashbuckler. Latterly he has developed qualities that indicate larger possibilities in the political arena.

But Mr. R. R. Gamey transgresses the rules of decent business and the laws of good taste when he uses his position as a member of the Legislature to give colour to his mining advertisement. Mr. Gamey may or may not be a good adviser as to mining speculation. If he is well qualified he does not need to use his M.P.P. as a lure. If he is not a safe guide, then his

title is distinctly a source of danger. In any case he was elected not to sell mining stocks, but to serve the interests of his constituents.

If, therefore, Mr. Gamey wishes to be remembered by posterity as anything more than a huckster of dubious scrip, he will do well to respect the distinction that must exist between R. R. Gamey, the ambitious politician, and R. R. Gamey, the broker and promoter. Meanwhile, caveat emptor!

### EDITORIAL NOTES.

The recently elected president of the American Institute of Mining Engineers, Mr. D. W. Brunton, is a native of Canada. Mr. Brunton is a consulting mining engineer, practising in Denver. His invention, the Brunton mechanical sampler, became the basis of a large system of public sampling works in Colorado, Utah, and Nevada.

The Financial Times (London) predicts that serious difficulties will arise when, on July 1st of this year, the Eight Hours Bill comes into force. Our contemporary's remarks are applied to the coal owners and miners of South Wales. The question of increased pay for miners working in "abnormal places" will, it is thought, become one of the most prominent causes of dispute.

The catholicity of the mining profession has been illustrated by many such cases as the election of Mr. Brunton. Dr. James Douglas, past president of the American Institute, is a Canadian. Mr. W. A. Carlyle, whose appointment to an important technical chair in London was noted lately, is a Canadian. To these names we might easily add those of a score of prominent Canadian engineers employed in foreign countries.

For some years the Ontario Government has attempted to provide practical instruction for prospectors and miners. This has been done by means of holding technical classes at various mining camps during the summer season. The Transvaal University College has followed Ontario's example. A course of lectures to miners is to be inaugurated at various local centres along the reef. Instruction will be given in subjects pertaining to mining and mining economics.

## ELEVENTH ANNUAL MEETING OF THE CANADIAN MINING INSTITUTE.

Montreal, March 3, 4, and 5, 1909.

Early on Wednesday morning, March 3rd, in the rotunda of the Windsor Hotel, Montreal, mining men from east and west and north exchanged their annual greetings. A particularly large contingent from Cobalt, Sudbury and adjoining districts was much in evi-

dence. Other parts of Ontario were well represented. Quebec's delegates were not less numerous than heretofore. British Columbia, Alberta and Nova Scotia were also represented.

At 10.30 a.m. proceedings were opened officially in

the Ladies' Ordinary. President W. G. Miller read the Presidential Address, the text of which is given below:—

### PRESIDENTIAL ADDRESS.

Gentlemen,—The Canadian Mining Institute, founded in 1898, has entered on its second decade. The questions may then be asked, what has the Institute accomplished, what progress has been made in the mineral industry during the last ten years, and what is the outlook for the future?

We have first to consider the work of the Institute itself. At the annual meeting in 1898 we had a membership of 63. At the present time our membership is about 850, including student members, and it is growing rapidly. We shall soon have 1,000. The Institute has covered a wide field. Its most important work, probably, has been that of the publication of papers. Our last annual volume consists of over 600 pages. Few of these papers would have been written had the Institute not existed. Mining men are proverbially reluctant to appear in print, and their valuable experience is frequently lost. Local branches have much to do with getting papers. Men will prepare papers under local encouragement when they would pay little attention to written communications from the Secretary. Moreover, the student membership has had a beneficial influence in encouraging the budding members to write for our transactions.

When arrangements are completed for the establishment of libraries in connection with the branches, the work of the Institute will be broadened still further.

During the ten years of its existence the Institute has been called upon to give advice on legislation and on other matters concerning the mineral industry. Much more has been accomplished in this connection by the Institute than could have been achieved through other channels.

Several excursions to mining centres have been held, which have done much to make Canada's mineral resources known. Among these excursions may be mentioned that to British Columbia in 1899, that to Quebec Province and to Nova Scotia, in company with the American Institute of Mining Engineers, in 1900, that to Cobalt in 1907, and lastly that of 1908, from the Atlantic to the Pacific. This excursion was a greater success than the most sanguine of our Council or members could have expected it to be. The character of the guests of the Institute from Great Britain and abroad insured success.

The work of arranging for the excursion and carrying it to a success fell chiefly on our Secretary, Mr. Mortimer-Lamb, and on our Treasurer, Mr. Stevenson Brown. While their fellow-members of Council have expressed to these two gentlemen their pleasure at the success achieved by the excursion, this annual gathering seems to me a suitable place to thank our Secretary and our Treasurer, on behalf of the membership at large, for the care which they gave to the arrangements for the excursion. The Secretary is also to be congratulated on the bulletin which he has published, recording the events of the trip.

At the last annual meeting both the Secretary and the Treasurer told me they intended to work with the object of making the past year the most successful in the history of the Institute. We have to thank them for the efforts which they have made, and for the success which they have achieved.

Mr. Stevenson Brown, having served as Treasurer of the Institute for the past ten years, is now retiring from that office. I can assure him that he has the best wishes of the members of the Institute, and we hope that his association with the Institute as its Treasurer will be a pleasant memory. When he recalls the early days of the Institute and the progress during later years, and when he watches the development in the future, it is to be hoped that Mr. Brown will find some recompense for the ten years in which he has served as an executive officer.

Our Secretary, in the Excursion Bulletin, has referred to many men in various parts of Canada to whom thanks are due for the success of the trip. On behalf of the members generally, I wish to again tender thanks to all. Time will not permit of my referring to individuals or organizations, but I wish to express thanks to another official of the Institute for the care with which the arrangements in the West were looked after. I refer to Mr. E. Jacobs, the Secretary of the Western Branch, who did much towards making the trip through British Columbia so successful.

I have briefly described the work done by the Institute, but greater than all else are the opportunities which are given the mining men of Canada, from one end of the country to the other, of getting acquainted with one another. These annual meetings would be very valuable even if no papers were read. Men get acquainted, compare notes and form friendships which they would have no other opportunity of doing. All this has a broadening effect; and I am sure that every one of us after an annual meeting goes back to his work better equipped to carry it on.

In the year 1898, when the Institute was organized, Canada's annual mineral output was valued at \$38,412,431. In 1908 the value reached \$87,323,000. This increase is highly satisfactory, and offers encouragement for the future. We may truthfully say, without being accused of boasting, that no country gives greater hope for the future in mining than our own.

For years past there has been no doubt that the territory bordering on the Atlantic, with its great coal deposits and other mineral resources, has a bright future as a mining country. Similarly, every one has agreed that the part of our country bordering on the Pacific Ocean is destined to become great as a mineral producer. Mountains with the same characteristics extend from old Mexico and the United States through British Columbia and the Yukon. It has been estimated that the metal output of Mexico and the United States in the mountainous tracts adjacent to the Pacific has amounted to over \$3,500,000 for each mile in length of these mountainous tracts. The Canadian territory to the north has then great promise. While, therefore, all will admit that the Canadian territories on the Atlantic and those on the Pacific are destined to become centres of a great mineral industry, what is to be said of that vast Canadian region which lies west of the Acadian Provinces and to the east of the Rocky Mountains?

In the past the people of Quebec and Ontario have heard little of their resources other than those of the forest and the soil. It has been difficult, as most of us know, to arouse much interest in the mineral possibilities of these two provinces.

One-half of the 3,750,000 square miles of Canada, chiefly in the provinces of Quebec and Ontario and in the territories to the north and northwest, is underlain by rocks of pre-Cambrian age. The mining experience of Canada has been drawn, naturally, largely from the

United States, where the pre-Cambrian rocks cover a small extent of territory. It is but to be expected then, especially as the great part of the pre-Cambrian region of Canada is accessible with difficulty, that it would, up to the present, have attracted little attention as a mineral field. If we consider, however, what the pre-Cambrian region has already done, it seems to me we should feel that these vast areas of the old rocks give great promise. Personally, I feel no doubt about it. These pre-Cambrian regions are destined to be the scenes of great mineral development.

A small point of these old rocks extends from the north into the States of Minnesota, Michigan, and Wisconsin. It is this pre-Cambrian area that has caused the United States to become the world's greatest producer of iron and steel, and the copper mines of Michigan have long been famous.

The pre-Cambrian country over much of its surface offers little inducement to the agriculturalist, although it possesses some fertile areas. Settlement has for this reason made little advance into the north, but along the thin line of settlement in Ontario we have, in the pre-Cambrian, the world's greatest producer of nickel, Sudbury, and the silver camp, Cobalt.

Areas underlain by rocks similar to those in the iron and copper fields of Michigan and in the iron ranges of Minnesota, and to those of Sudbury and Cobalt, are known to occur at numerous points over the 1,800,000 square miles of the Canadian pre-Cambrian regions. It does not require the vision of a prophet to foretell what will be the mineral development when our pre-Cambrian regions are adequately explored and prospected. The mining men of Canada, and their society, the Canadian Mining Institute, have a great mineral field before them—half a continent. We are scarcely at the beginning. Let us make the best use of our opportunities. Let us avail ourselves of the experience of older mining countries, have faith in Canada and in ourselves, and a firm belief in the future of our industry.

In conclusion, I wish to thank the members of Council and the membership at large for the pleasant year I have had in the Presidency of the Institute. My labors have been made light by the kind co-operation and assistance which I have received on every hand.

I now have pleasure in declaring the Eleventh Annual Meeting of the Institute open for the reading of papers, the transaction of business, and especially for social interviews and the interchange of good-fellowship.

The annual report of the Council was then read by the secretary, Mr. H. Mortimer-Lamb. The retiring treasurer, Mr. J. Stevenson Brown, presented his statement and balance sheet, and the report of election of council was announced.

After general business discussion, Mr. J. McLeish, statistician of the Department of Mines, Ottawa, read a preliminary statement of the mineral production of the Dominion for 1908. Similar statements were read for Quebec by Mr. J. Obalski, and for Ontario by Dr. W. G. Miller, representing Mr. T. W. Gibson, Deputy Minister of Mines. All three statements appear on other pages of this issue of the Canadian Mining Journal.

During the afternoon session Mr. G. R. Mickle, Assessor of Mines for Ontario, read a most important paper on "The Probable Effect of an Acreage Tax on Mining Lands in Ontario." Mr. Mickle traced the

history of mineral land taxation in Ontario, the changes in units of area, the development and effect of the acreage tax, and the present condition of the several mining divisions of the province. Copies of a blueprint map were distributed to illustrate the paper. It was demonstrated that one effect of an acreage tax of two cents per acre has been the revision to the province of many thousands of acres of mining lands in 1910.

Mr. E. L. Fraleck, of Cobalt, Ont., followed Mr. Mickle. He spoke on "The Application of an acreage tax to the Mineral Areas of Central Canada." Mr. Fraleck urged the imposition of a much larger acreage tax than has heretofore obtained. A tax of from ten to twenty-five cents per acre would, he contended, throw open the large areas now held closely by speculators and others, and would undoubtedly facilitate legitimate exploitation and development.

Mr. Fraleck adduced illustrations from the laws of Mexico and of many sections of the United States. His matter and style were convincing. After a general discussion, in which Messrs. Coste, Barlow, Hay, A. H. Smith, Brock, Langford, and others took part, the meeting declared itself in favour of acreage tax that should be heavier than that at present imposed.

To deal with questions such as these and with the larger problems of mining legislation, such as the construction of practicable Federal laws, the simplification of the various provincial laws, and the co-ordination of all of these, it was unanimously decided that a permanent committee of the Council of the Institute be instructed to approach the Federal authorities and urge the immediate appointment of a Royal Commission. As to the need of this step there appeared to be entire unanimity.

Through the courtesy of the authorities of McGill University, the members of the Institute were their guests on Wednesday evening, at a lecture on "The Electric Furnace with Special Reference to the Electro-Metallurgy of Steel." The lecture was delivered by Dr. Alfred Stansfield in the Chemistry and Mining Building. After the lecture Dr. Stansfield gave practical demonstrations of the conversion of pig iron into steel in the induction furnace. The lecture was attended by a large number.

#### Thursday.

The Thursday morning session was one of the most instructive ever held by the Canadian Mining Institute. The first paper read was that of Mr. S. F. Emmons, of the U. S. Geological Survey. Mr. Emmons is the senior officer of the U. S. Survey. He has studied for almost 40 years the principles of ore deposition as applied to American occurrences. His address was an outline of the rise and fall and development of various theories of the formation of ore deposits. He noted the predominance in late years of the view that ore deposits are largely and generally connected with igneous or volcanic action. He showed that the work of the U. S. Survey had been of supreme value to the mining industry of that country. Since Canada is a vast and sparsely settled country, Mr. Emmons urged that the labours of our own Survey be intensive over small and important mining areas, rather than extensive over wide and doubtful territories.

Mr. Waldimar Lindgren, whose name needs no introduction to Canadian readers, spoke next. His subject was "Metallogenetic Epochs." Briefly, his theme was a comprehensive review of the successive eras in the world's geologic history which have been characterized by the deposition of distinctly different metals

and ores. In a later issue of the Canadian Mining Journal we shall deal with Mr. Lindgren's paper more fully. Meanwhile it is sufficient to state that it was one of the outstanding features of the convention. Prof. J. F. Kemp opened the discussion of both of these papers. He was followed by Mr. J. B. Tyrrell, Dr. Frank D. Adams, Prof. M. B. Baker and others.

The closing feature of the morning session was an illustrated paper read by Dr. A. C. Lane, State Geologist, Michigan, U.S., on "The Mine Waters of Michigan." The importance of a knowledge of the chemical constituents of mine waters and the bearing of that knowledge on the operations of pumping, sinking, and developing, were well brought out by Dr. Lane.

Thursday afternoon was devoted to a business session. The proposed amendments to the by-laws were rejected by large majorities. It was decided to refer amendments to a committee of the Council. The discussion rose nearly to boiling point once or twice. In general the meeting appeared to be opposed to any radical alteration of the present by-laws—at least to alterations that do not make for simplicity and efficiency.

As there was a short time to spare at the end of the business session, the President requested Mr. E. T. Corkill to read his paper on "Mine Accidents."

#### Thursday Evening.

The smoker has become part and parcel of the Institute's proceedings. The capacious Ladies' Ordinary was filled to the doors when, at 8.30 p.m., Chairman G. G. S. Lindsey called the meeting to order, "order" in this connection meaning simply less chaos. The evening was enlivened by a diversity of amusements. The organ notes of Mr. N. MacDonald punctuated every minute. Hereafter a MacDonald obligato will be demanded by dozens of Mr. MacDonald's admirers, new and old.

Perhaps the most instructive item on the programme was Dr. Kemp's magnificent and luminous illustrated lecture on the origin of ore deposits. By what means Dr. Kemp had secured his marvellous slides we stay not to enquire. Politeness forbids. But we feel deeply the honour at having been present at this revelation of scientific acumen and enterprise. Dr. Kemp, in that passionless, calm, dignified style that marks the true geologist, threw picture after picture on the wall to illustrate his theory of ore deposition. The volcano, a sight that congealed one's blood, was followed by the fissure; the fissure by the hot spring; the hot spring by the deposition of a huge quartz vein, and so on until the last link, the modern cyanide plant, was projected visibly upon the white canvas. So lurid was the whole presentment that strong men sobbed, and the speaker himself could scarcely suppress his emotions.

A programme of songs and anthems and specialties provided a cheerful evening for the two hundred and fifty guests present.

#### FRIDAY.

The Friday morning session commenced with the reading of a paper by Dr. J. F. Kemp, of Columbia University. Dr. Kemp discussed at length the question, "What is an Ore?" Mr. Waldimar Lindgren and Dr. J. W. Woodman contributed to the discussion. One definition that appeared to meet with general approval reads thus: "An ore is a mineral aggregate containing enough metal to be extracted at a profit." The discussion was animated.

Dr. Adams then made a few remarks about an occurrence of ore at the City of Cobalt Mine, Cobalt, Ont., and Mr. J. C. Murray presented a paper by Mr. F. W. Gray on "Oxygen Breathing Apparatus in Coal Mines."

The afternoon session was taken up with continued reading of papers. Mr. D. B. Dowling's "Probable Chemical Changes in the Formation of a Coal Bed" was followed by Mr. Eugene Coste's on "The Origin and History of Coal and Petroleum." Director R. W. Brock then read "The Need of Recording Occurrences of Economic Deposits," and Prof. John A. Dresser presented a synopsis of a most interesting and carefully prepared paper entitled "The Mineral Resources of the Serpentine Belt, Quebec."

The session was thus brought to a close, and there remained only the annual dinner.

#### Annual Dinner.

Rarely has there been such a gathering as sat down to dine in the Ladies' Ordinary of the Windsor Hotel on the evening of March 5, 1909. The Governor-General, Earl Grey, had signified his intention to be present. The Hon. Mr. Templeman, Minister of Mines for Canada; the Hon. Mr. Cochrane, Minister for Ontario; Mr. J. Obalski, representing the Quebec department, and many other distinguished guests and representatives sat at the head table, where President Miller, with Earl Grey on his right, and Mr. Templeman on his left, occupied the seat of honour.

After duly honouring the toast of "The King," President Miller proposed that of "His Excellency the Governor-General," which was received with tremendous enthusiasm. His Excellency, in responding, referred in terms of high appreciation to the work of the Institute. In tracing the progress of mining education he touched upon the labours of the late Principal Grant, of Queen's University, through whose enthusiasm the School Mining of Kingston was brought into being, the first institution of its kind in Canada. Glancing over the progress of Canada's mining industry, His Excellency predicted that within a short period our mineral output will be doubled.

Other speakers were the Hon. Mr. Templeman, the Hon. Frank Cochrane, Mr. Goodeve, M.P., Mr. G. G. S. Lindsey, Mr. Obalski, Dr. J. F. Kemp, Dr. A. C. Lane, Dr. J. W. Woodman, Mr. J. E. Hardman, Mr. E. L. Fraleek and Mr. F. W. Guernsey. The dinner was continued informally for some time after the distinguished guests had departed.

#### THE MINING SOCIETY OF NOVA SCOTIA.

##### Seventeenth Annual Meeting.

The seventeenth annual meeting of the Mining Society of Nova Scotia was held on March 3 and 4, at the rooms of the society, Hollis Street, Halifax, N.S.

On the afternoon of Wednesday, March 3rd, proceedings commenced with the reading of a paper by the Hon. Robert Drummond. "The Mine and the Farm" was the subject-title. Citing European countries as examples, Mr. Drummond argued that with the development of the mining industries all the industries would follow. A paper submitted by Dr. R. W. Ells, of the Geological Survey of Canada, on the "Oil-shales of New Brunswick," was read by Mr. Hugh Fletcher. It described the results of tests conducted in Scotland on a forty-ton experimental shipment of New Brunswick

oil-shales. The announced results were most satisfactory.

Mr. F. H. Sexton, Director of Technical Education, then spoke of the purpose and benefits of last summer's visit of the European mining engineers.

The retiring president, Mr. C. J. Coll, read a paper describing a dam built in the Macgregor shaft, Stellarton, in fighting a fire. The paper was illustrated with several large diagrams.

The Hon. Mr. Drummond, in the course of his paper mentioned above, brought out some striking facts. In the four coal mining counties of Nova Scotia the sum of \$7,890,000 is distributed annually in wages. If supplies be included in this estimate, the total becomes \$10,003,000. The number of employees is 16,750, and 57,350 souls are numbered as dependent upon these employees. Altogether there are 125,000 dependent in large degree upon coal mining. In Cape Breton County, according to Mr. Drummond's estimate, the coal mining companies distribute \$100 in wages per annum per head of population. Including supplies this figure is increased to \$128.

On Wednesday evening the seventeenth annual banquet was held at the Halifax Hotel. The gathering, while not as large as usual, was representative and enthusiastic. The toast list was short, as all toast lists should be. After the King's health had been drunk, the toast of "Canada" was responded to by Chief Justice Townsend, who, after alluding to mining as the chief industry of the country, expressed the hope that in future he would be given less to do officially with the miners of the province and that all would be peace and quietness.

To the toast of "The Provincial Government" Premier G. H. Murray responded. He spoke most warmly of the work done by the Mining Society of Nova Scotia, and by its secretary, Mr. A. A. Hayward.

The Hon. C. P. Chisholm spoke briefly to the toast of "Our Mines," as also did the Hon. W. T. Pipes. "Sister Societies" and "Our Guests" were the two concluding toasts. Throughout the dinner musical numbers and recitations varied the programme.

The menu card is one of the most effective that we have seen. A bronze-coloured print of Vaerenbergh's "The Miner" appears on the cover against a background of delicate blue. The menu is made up entirely of traditional geological dishes, some of which, we grieve to state, have room for grave complaint against the printer.

Announcement of the results of the annual elections was made on Thursday, March 4th. The following were declared elected:—

President—T. J. Brown.

Vice-President—F. H. Sexton.

Second Vice-President—G. J. Partington.

Secretary—A. A. Hayward.

Treasurer—H. M. Wylde.

Council—Hon. R. Drummond, Hon. B. F. Pearson, G. W. Stuart, C. C. Starr, J. R. Cowans, Alex. Dick, R. H. Brown, T. Cantley, A. L. MacCallum.

The session was brought to a close after the reading of a paper on tungsten occurrences in Nova Scotia, by Mr. A. L. MacCallum, and a discussion of Government aid to Nova Scotian gold mines. The discussion was led by Mr. A. A. Hayward.

## Mining Methods and Equipment at the British Columbia Copper Company's Mother Lode Mine.\*

By M. D. McIntosh, Superintendent at Mother Lode Mine.

The following is a brief description of the system of mining and equipment at the British Columbia Copper Company's Mother Lode Mine, Boundary District of British Columbia.

At this mine there is one distinct ore body, which already has been opened by four levels, work on a fifth having been only recently started. The ore body is a contact deposit between limestone on the foot-wall and greenstone on the hanging-wall; the dip being about 70 degrees to the east, and the strike northeast with a southerly pitch. Most of this ore has been formed by replacement and alteration in the greenstone, the limestone being as a rule but little affected.

Several dykes of porphyry, from one to twenty feet thick, intersect the ore at approximately right angles to the dip, and frequently prove troublesome in mining. East of the quarries the ore is covered with a flow of later, and barren, eruptive rock, which has limited the width of the quarries to about half that of the ore body.

The ground is very firm and stands well—a fact of the greatest importance in the operation of the mine, and without which it would be impossible to maintain in safety the large open spaces underground.

All four levels are connected by stopes and raises. On each level are parallel drifts from about 50 to 70 feet apart, connected by crosscuts and drifts run at

various angles, thus allowing ore trains to pass each other at different parts of the mine. The first drift is along the foot-wall of the ore body, the second in the centre, and the third close to the hanging-wall. By this method any number of trains may be conveniently handled on the level.

Chute raises are begun at intervals of 35 feet apart, every alternate chute being placed on the opposite side of the drift. By this arrangement the stopes on each level are easily connected, and the chutes also serve for ventilation purposes. The chutes are started in the same manner as a raise; after raising 8 or 10 feet a beginning is made to funnel them on all sides at an inclination of about 35 degrees. When several connect with one another the stope is extended, leaving pillars at convenient places. This preliminary work having been done, the stopes are carried to the next level above in a series of large spiral raises. After connecting the levels, tripods are used in the bottom of the stopes.

When any level is thoroughly connected with the next lower level by means of these spiral raises, the ground is then in such shape for caving that work can be started at the farthest point from the shaft and the

\*Paper read before the Canadian Mining Institute.

pillars between the spirals blasted doyn, allowing the ore to drop to the level below. In this way the level is kept safe while the work is progressing on the other levels.

The large quarries, of which there are six, are all connected with the 60-foot level, while in one place connections are made with the 200-foot level. This has been found a great advantage, as the ore, falling so far, is thereby broken much finer, effecting a great saving in powder for bulldozing and involving much less labor for the chutemen and skipmen in handling the ore.

The ore is conveyed to pockets at the shaft in cars drawn by horses. Two types of cars are used. On the lower levels the cars are 30-ton side-dumping; on the 60-foot level trains are loaded of three and four 3-ton scoop cars. An automatic dump unloads them at the pocket. A chuteman with a helper loads the ore from the chutes. In case a chute gets blocked he does the necessary blasting to clear it. The chute openings are 3x4 feet, and are built of heavy round timbers. The bottoms and sides are 4x10-inch timbers lined with 1/4-inch steel plate. The collar braces are covered in the same manner. Two descriptions of gates are used—one a circular iron chute gate, and the other the old style chute boards.

The shaft is vertical, with four compartments, each compartment being 4 1/2 x 5 feet. Two compartments are used exclusively for ore, one for lowering and hoisting the men, and the fourth for ladder and pipe way.

Connected with the shaft are large storage pockets at each level, from which the ore is hoisted by two skips, each holding four tons, these being loaded by means of finger gates operated by compressed air.

One 20x36 Jenckes hoisting engine is used. It is easily capable of hoisting the skips 400 feet per minute, or 60 skips per hour, from the 400-foot level (the deepest now opened), or at the rate of 240 tons per hour. The cage is operated by one independent 80 h.p. single drum hoist, and is counterbalanced by sliding weights run in the ladder compartment of the shaft.

There are two compressors, one a 16x25x26 D. 2. T. Rand engine, capacity 3,400 feet of free air per minute, and one Ingersoll-Sergeant machine of 2,800 feet capacity. The Rand is driven by a 600 h.p. Canadian General Electric motor, and the Ingersoll by a 500-h.p. Westinghouse motor.

The writer has devised what has proved to be a most satisfactory system for separating the moisture from the compressed air, consisting of a 100 h.p. boiler submerged in a tank of water. The air passing through the boiler is cooled and the moisture drawn off. After once being filled, only a small quantity of water is required to keep the tank cool.

There are two crushers, one a 36x42-inch jaw opening, and the other a 16x34 Farrel-Bacon machine. These are connected with a 100 h.p. motor and a 100 h.p. steam engine, so arranged that either can be driven by steam or electricity at will, which arrangement effectually guards against failure of crushing operations. After crushing the ore, it is conveyed to the shipping bins by means of a 10-ply rubber belt, 36 inches wide and 167 1/2 foot centres. The bins have a capacity of 2,000 tons, of which about half will run into the cars.

The hoisting engines are arranged so that they may be operated either by steam or compressed air. The steam is supplied by two 60 h.p. boilers. One is kept in constant use for general heating purposes. Ordinarily compressed air is used, and this is found to be considerably less costly than steam.

During the month of December the underground force at the Mother Lode consisted of 1 foreman, 4 shift bosses, 126 miners, 4 timbermen, 4 pipemen, 16 muckers, 16 chutemen and trammers; 1 trackman, 4 nippers, 4 skipmen, 2 cage-tenders, 1 powderman and 4 blasters—a total of 187. The total force employed at the mine, exclusive of boarding-house employees, was 235. The daily average output of ore was 1,545 tons. The daily average output per man was 6 1/2 tons for all men employed.

## MINE ACCOUNTING.

By John G. Grant, B.A., Chartered accountant, Toronto, Ont.

(Continued from last issue)

### III.

Men working in mines are paid according to the length of time worked or according to the amount of work accomplished. The first method is used for the men who are the company's own employees; the second for the men working under contract to the company.

In large companies a timekeeper is employed to take charge of the time books and pay sheets, but in small

concerns the storekeeper or foreman may do the work. Every morning the man whose duty it is makes a round of the works and enters up in the following form the men who are at work:—

The entries are then copied into another book called the "Time Book," with the same ruling, but with the addition of two columns, one for the rate per day and the other for the amount. In the "Time Book" the

| Time from |            | to   |     |      |     |      |     |     |
|-----------|------------|------|-----|------|-----|------|-----|-----|
| Name      | Occupation | Sund | Mon | Tues | Wed | Thur | Fri | Sat |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |
|           |            |      |     |      |     |      |     |     |

Columns continued so as to  
contain two weeks

men's names are grouped on the basis of their occupation, so that all the blacksmiths, for example, will be in the same group and similarly the carpenters, engineers, etc. This will give facility in making an analysis of the cost of each department. To find the cost in wages of any new work, and for the distribution of the charges for repairs, it is necessary for the foremen of the different classes of workmen to keep "Time

Sheets," on which each man enters what he is doing and the number of hours spent in the work. Although it is customary to keep account of this in a very rough-and-ready fashion, better results will be obtained by using a printed form, which, by giving more accurate results, may be used as a good check on the Time Book. The following is a simple form of a Time Sheet:—

|         | from to         |            |      |            |
|---------|-----------------|------------|------|------------|
|         | Name of Workmen | What doing | Time | Total Time |
| Monday  |                 |            |      |            |
| Tuesday |                 |            |      |            |
|         |                 |            |      |            |
|         |                 |            |      |            |

In general, the sinking of shafts, driving of levels, etc., are done by contract, a fixed price being paid per linear foot. In the case of shaft-sinking the rate per foot increases according to the depth attained. A book

ruled as follows should be kept for purposes of comparison with other work of the same character and as a check on the amount of work paid for:—

Contract Book

| Date | Name of Contract | Where Done | Conditions | Measurements | Paid for | Unpaid | Rate | Amount |
|------|------------------|------------|------------|--------------|----------|--------|------|--------|
|      |                  |            |            |              |          |        |      |        |
|      |                  |            |            |              |          |        |      |        |
|      |                  |            |            |              |          |        |      |        |
|      |                  |            |            |              |          |        |      |        |

At the end of each month an analysis of the wages is made, showing the average tonnage of ore raised per day and the average cost per ton in wages. This

analysis may be ruled up by the timekeeper himself on blank paper, as follows:—

Analysis of Wages

|                               | Jan | Feb | Mar | Apr | May | June | July | Aug | Sept | Oct | Nov | Dec |
|-------------------------------|-----|-----|-----|-----|-----|------|------|-----|------|-----|-----|-----|
| Total Days Worked Underground |     |     |     |     |     |      |      |     |      |     |     |     |
| Aboveground                   |     |     |     |     |     |      |      |     |      |     |     |     |
| at other work                 |     |     |     |     |     |      |      |     |      |     |     |     |

| Tons Raised                   |     |     |     |     |     |      |      |     |      |     |     |     |
| Average Tonnage per Day       |     |     |     |     |     |      |      |     |      |     |     |     |
| Total Wages Underground       |     |     |     |     |     |      |      |     |      |     |     |     |
| Aboveground                   |     |     |     |     |     |      |      |     |      |     |     |     |
| on other work                 |     |     |     |     |     |      |      |     |      |     |     |     |
| Paid                          |     |     |     |     |     |      |      |     |      |     |     |     |
| Tons Raised                   |     |     |     |     |     |      |      |     |      |     |     |     |
| Average Wage Cost per Ton     |     |     |     |     |     |      |      |     |      |     |     |     |

It will be noticed that columns are left for the 12 months, by which a convenient comparison is shown between the costs per ton raised for the different months. In the "total wages for other work" the contract work on shaft-sinking may be included or not,

depending on the desire of the company to charge this work to revenue or capital account.

To prepare an analysis of cost it is necessary to bring together the cost of labor, material, and fixed charges, such as mine manager's salary, etc. This

analysis may be divided into two parts, one dealing with the raising of the ore and the other with the preparing it for market (concentration). Only the first of these two will be shown here, as the method of

preparation of the second can be obtained from it by analogy. A printed form should be used similar to the form shown below:—

### Cost Analysis

| Raising Ore  | Total Cost |       |               |       | Average per Ton |               |
|--------------|------------|-------|---------------|-------|-----------------|---------------|
|              | Last Month |       | Current Month |       | Last Month      | Current Month |
|              | Amount     | Total | Amount        | Total |                 |               |
| Salaries     |            |       |               |       |                 |               |
| Laborers     |            |       |               |       |                 |               |
| Machinery    |            |       |               |       |                 |               |
| 1. Labor     |            |       |               |       |                 |               |
| 2. Power     |            |       |               |       |                 |               |
| Hauling      |            |       |               |       |                 |               |
| 1. Labor     |            |       |               |       |                 |               |
| 2. Materials |            |       |               |       |                 |               |
| 3. Power     |            |       |               |       |                 |               |
| Repairs      |            |       |               |       |                 |               |
| 1. Labor     |            |       |               |       |                 |               |
| 2. Materials |            |       |               |       |                 |               |
| 3. Sundries  |            |       |               |       |                 |               |
| Tools        |            |       |               |       |                 |               |
| 1. Labor     |            |       |               |       |                 |               |
| 2. Materials |            |       |               |       |                 |               |
| Sundry Costs |            |       |               |       |                 |               |
| 1. Lighting  |            |       |               |       |                 |               |
| 2. Pumping   |            |       |               |       |                 |               |
| Etc          |            |       |               |       |                 |               |
| Total Cost   |            |       |               |       |                 |               |

In the case of a silver mine the book required to record the shipment of ore is very extensive, and I will not show the ruling here. I will mention, however, what it is necessary to record, so that very little ingenuity will be required to put the columns side by side. The Sales Book must show the date of shipment, the car number, where the ore was taken from, weight at the mine, weight per railroad advice, the result of the assay, name of purchaser, sampling charge, amount per ton, total value of shipment, freight paid, and amount received.

In the monthly report to the head office, information must be shown as to the salaries and wages paid, the purchases of stores, stock of stores on hand and stores used, the sales during the month, the ore raised and treated, and the amount of cash on hand. If the company has an audit at the mine, only summaries need be sent, and no vouchers need accompany these. If no audit takes place at the mine, it is necessary to send full details of all classes of transactions, with vouchers for all payments. The first method is the natural way, and lessens the work both of the head office and of the mine office. By this method the analysis shown above is sent as the wages report, the smelters send two reports of the sales, one of which is sent to the head office, the analysis of costs is sent, and a summary of

the "Stores Ledger." Thus, you see, very little extra work is needed to place the head office in full possession of all the facts necessary for the preparation of their Balance Sheet.

In the next issue we will follow these reports to the head office and prepare books to record the facts shown therein.

(To be continued.)

### RESCUE WORK IN COAL MINES.

Speaking before the Midland Institute of Mining, Civil and Mechanical Engineers, Doncaster, England, Sergeant A. Winborn, who has charge of the joint rescue station at Tankersley, stated that the rescue work done after the Hamstead disaster was probably the most severe test to which any rescue apparatus had ever been subjected. Scores of miners, totally unprotected by breathing apparatus, begged the opportunity of descending the mine. The method of effecting a rescue by means of sheer muscular force and daring, without the aid of scientific apparatus, appealed to the average miner most. Miners viewed the advent of "new-fangled" apparatus with distrust. Consequently they must be brought by experience to a realization of its practical value.

# PRELIMINARY REPORT OF THE MINERAL PRODUCTION OF CANADA IN 1908.

Prepared by John McLeish, B.A., in charge of the Division of Mineral Resources and Statistics.

ANNUAL Mineral Production in Canada since 1886.

| Total value, non-metallic.....            |              | 32,479,006 |

- (a.) Quantity of product sold or shipped.  
 (b.) The metals, copper, lead, nickel and silver are for statistical and comparative purposes valued at the final average value of the refined metal in New York. Pig iron is valued at the furnace and non-metallic products at the mine or point of shipment.  
 (c.) Copper contents of ore, matte, &c., at 12 208 cents per pound.  
 (d.) The total production of pig iron in Canada in 1908 was 630,835 short tons valued at \$8,111,194, of which it is estimated about 99,420 tons valued at \$1,664,302 should be attributed to Canadian ore and \$51,415 tons valued at \$6,446,892 to the ore imported.  
 (e.) Lead contents of ore, matte, &c., at 4 200 cents per lb.  
 (f.) Nickel contents of matte shipped at 43 cents per lb.  
 (g.) Silver contents of ore, &c., at 52 864 cents per lb.  
 (h.) Gross return from sale of gas.  
 (i.) Deducted from the amount paid in bounties and valued at \$1 41½ per barrel.

## PRELIMINARY REPORT ON THE MINERAL PRODUCTION OF CANADA IN 1908—Continued.

| Total value, 1908.....                                |              | 87,323,849 |

A preliminary review of the mineral production in Canada in 1908 shows a total mineral output valued at slightly over 87 million dollars as compared with a little less than 87 million dollars in 1907.

The industry has therefore in the aggregate more than held its own despite the large decrease in the prices of the metals. That this falling off in the prices of the metals has been an important and serious question for the metal mining industries, will be better realized when it is stated that had the metals, copper, silver, lead and nickel maintained as high average prices in 1908 as in 1907, their total production in Canada in 1908 would have been worth over 8,000,000 dollars more to the producers than was actually the case.

A comparison of average monthly prices of metals in 1907 and 1908 showing the decreases in 1908 both in price and percentage is given hereunder:—

### COMPARISONS OF PRICES OF METALS, 1907 and 1908.

|              | 1907.  | 1908.  | Decrease in 1908. | Percentage of Decrease. |
|--------------|--------|--------|-------------------|-------------------------|
|              | Cts.   | Cts.   | Cts.              | %                       |
| Copper.....  | 20 004 | 13 208 | 6 796             | 33 97                   |
| Lead.....    | 5 325  | 4 200  | 1 125             | 21 12                   |
| Nickel.....  | 45 43  | 43 2   | 2 41              | 4 44                    |
| Silver.....  | 65 327 | 52 864 | 12 463            | 19 07                   |
| Spelter..... | 5 962  | 4 726  | 1 236             | 20 73                   |
| Tin.....     | 38 166 | 29 465 | 8 701             | 22 79                   |

The outstanding feature of the mining industry during the year has undoubtedly been the silver production, a total increase of over 72 per cent being shown in the number of ounces produced. The metals copper and gold also show important increases in quantity produced, whilst iron, lead and nickel were produced in slightly smaller quantity than in 1907.

In the non-metallic class, decreases in gypsum and petroleum are more than counterbalanced by increases in coal, asbestos, natural gas, salt, etc. The Portland cement industry shows a small increase in sales and a large increase in quantity of cement made with large stocks on hand at the close of the year.

The two following tables will illustrate these special features of increases and decreases, the first showing the total increases or decreases in value of some of the more important products, and the second the percentage increase or decrease in quantity as well as value:—

| Product.                         | Increase.  | Decrease.   |
|----------------------------------|------------|-------------|
| Copper.....                      |            | \$2,806,484 |
| Gold, Yukon.....                 | \$ 450,000 |             |
| Gold all other.....              | 726,494    |             |
| Pig iron, from Canadian ore..... |            | 318,005     |
| Lead.....                        |            | 621,599     |
| Nickel.....                      |            | 1,303,869   |
| Silver.....                      | 3,318,538  |             |
| Asbestos.....                    | 62,739     |             |
| Chromite.....                    | 9,107      |             |
| Coal.....                        | 1,185,393  |             |
| Gypsum.....                      |            | 71,213      |
| Natural gas.....                 | 197,023    |             |
| Petroleum.....                   |            | 309,986     |
| Portland cement.....             |            | 68,265      |
| Pyrites.....                     | 12,333     |             |
| Salt.....                        | 36,433     |             |

| Product.                                    | QUANTITY. |           | VALUE.    |           |
|---------------------------------------------|-----------|-----------|-----------|-----------|
|                                             | Increase. | Decrease. | Increase. | Decrease. |
|                                             | %         | %         | %         | %         |
| <b>Metallic—</b>                            |           |           |           |           |
| Copper.....                                 | 13.86     |           |           | 24.82     |
| Gold.....                                   | 14.03     |           | 14.03     |           |
| Pig iron, (from Canadian ore only).....     |           | 7.60      |           | 16.04     |
| Pig iron, (from home and imported ore)..... |           | 3.22      |           | 11.11     |
| Lead.....                                   |           | 4.22      |           | 24.45     |
| Nickel.....                                 |           | 9.66      |           | 13.67     |
| Silver.....                                 | 72.69     |           | 39.75     |           |
| <b>Non-metallic—</b>                        |           |           |           |           |
| Asbestos and asbestic.....                  | 0.33      |           | 2.73      |           |
| Coal.....                                   | 5.21      |           | 5.27      |           |
| Feldspar.....                               |           | 37.40     |           | 29.27     |
| Gypsum.....                                 |           | 29.83     |           | 11.01     |
| Natural gas.....                            |           |           | 24.00     |           |
| Petroleum.....                              |           | 33.07     |           | 29.32     |
| Salt.....                                   | 10.01     |           | 10.66     |           |
| Portland cement.....                        | 9.41      |           |           | 1.81      |

**Gold.**—For the first time in nine years the gold output shows an increase over the previous year. The Yukon output in 1908 is estimated at about \$3,600,000 as compared with \$3,150,000 in 1907, while a considerably increased production is also shown in the Province of British Columbia, derived chiefly from the Trail Creek ores, the placer workings having shown a smaller output.

In Nova Scotia the output in 1907 was \$282,686. Complete returns are not yet available for 1908, but the output was probably not over \$225,000.

Of the total gold output in 1908, over 44 per cent. was obtained from placer and hydraulic workings and 56 per cent. from sulphuret and quartz ores.

**Silver.**—The estimated silver production of Canada in 1907 was 22,070,212 ounces, shipped as fine bars, silver bullion, and obtained in matte, ore, etc., as compared with 12,779,799 ounces produced in 1907, an increase of over 72 per cent. Owing, however, to the much lower price received in 1908, the total value shows an increase of only 40 per cent. Over 87 per cent. of the output was obtained from Ontario, and the increase is all to be credited to this province, since there was a slight falling off in the silver output of British Columbia.

The price of refined silver varied between a maximum of 57 cents on the 8th January and a minimum of 47 5-8 cents on the 2nd of December, the average monthly price being 52.864 cents per ounce, as compared with 65.327 cents in 1907.

The output from the Cobalt district in the Province of Ontario again shows a very large increase over the previous year, nearly twice as much silver having been produced. Returns from 29 shipping mines show the ore and concentrates shipped as approximately 25,497 tons, containing 19,296,430 ounces of silver, as compared with 14,644 tons containing 9,982,363 ounces in 1907. Valued at the average price of refined silver for the year, the production in 1908 would be worth \$10,200,865, and it represents an average return of 756 ounces of silver or \$400 per ton of ore shipped, as compared with an average return of 681 ounces silver or \$445 per ton of ore shipped in 1907.

If the output of this district continues to increase at the present rate, Canada will in the immediate future become one of the chief silver producing countries of the world. The total silver production of the world in 1907 was approximately 193 million ounces, the chief contributing countries being, Mexico 65 million ounces, United States 59 million ounces, Australia 17 million ounces, Canada nearly 13 million ounces, Germany 12 million ounces. With an output of 22 million ounces in 1908 Canada probably moves up to third place, but

still does not produce more than from 10 to 12 per cent. of the world's output.

**Copper.**—Statistics of copper production in 1908 show a total output of 64,361,636 lbs., an increase of over 14 per cent. over the production of 1907. There was an increase of over 900,000 lbs. in the copper from the Sudbury mines, while preliminary statistics of production in British Columbia appear to show a very important increase in production in that province of over 7,000,000 lbs.

The New York price of electrolytic copper varied but slightly during the year, the lowest being 12 cents in February and the highest 14 1/4 cents in December, the average for the year being 13.208.

The total exports of copper in ore, matte and blister being, according to Customs Department returns, 25,568 tons.

**Lead.**—All of the lead production shown in the general table, viz., 45,725,886 pounds valued at \$1,920,487, was obtained in the Province of British Columbia. The production in 1907 was 47,738,703 pounds, valued at \$2,542,086, a decrease in quantity being therefore shown of about 4 per cent.

The total amount paid as bounty on lead production was, during the twelve months, \$139,064.57.

The exports of lead in ore, etc., during the year were 2,256 tons, and of pig lead 6,971 tons, or a total of 9,227 tons.

The price of lead in New York during the year varied between 3.60 and 4.60 cents, averaging about 4.2 cents per pound.

**Nickel.**—With the exception of the nickel contained in the ores shipped from the Cobalt district, the production of nickel in Canada is derived entirely from the well-known nickel-copper deposits of the Sudbury district. Previous to 1906 the output had been increasing steadily for a number of years. During the past three years however, the production has not varied very greatly. About 815 tons less matte was shipped in 1908 than in 1907. The nickel contents were also somewhat lower in 1908, averaging about 45.1 per cent. as compared with 48.1 per cent. in 1907. On the other hand the copper contents were higher in 1908.

Two companies are carrying on active operations, the Mond Nickel Co., at Victoria Mines, and the Canadian Copper Co., at Copper Cliff. The ore is first roasted and then smelted to a Bessemer matte containing from 77 to 80 per cent. of the combined metals, copper and nickel, which is shipped to the United States and Great Britain for refining.

The price of refined nickel in New York was quoted during the first nine months at from 45 to 50 cents per pound, and during the balance of the year from 40 to 45 cents according to size and terms of order.

The above figures do not include the nickel contents of the silver-cobalt ores from the Cobalt district, of which it is difficult to obtain satisfactory returns. The shippers of silver-cobalt ores receive little or no return for the nickel contents, although this metal forms an important constituent of the ore.

**Iron Ore.**—The total shipments of iron ore from mines in Canada in 1908 were 203,490 short tons, valued at the mine at \$486,857, as compared with 312,496 tons valued at \$666,941 in 1907. The greater part of this production was from the Helen mine, Michipicoten, delivered to Midland and Hamilton. During 1908 very little Canadian ore was exported.

**Pig Iron.**—The total production of pig iron in Canada in 1908 from both Canadian and imported ores

The following were the aggregate results of the operations on the nickel-copper deposits in Ontario in 1906, 1907 and 1908:—

|                                       | 1906.              | 1907.              | 1908.              |
|---------------------------------------|--------------------|--------------------|--------------------|
|                                       | Tons of 2,000 lbs. | Tons of 2,000 lbs. | Tons of 2,000 lbs. |
| Ore mined.....                        | 343,814            | 351,916            | 409,551            |
| Ore smelted.....                      | 340,059            | 359,076            | 360,180            |
| Bessemer matte produced.....          | 20,364             | 22,041             | 21,197             |
| " " shipped.....                      | 20,310             | 22,025             | 21,210             |
| Copper contents of matte shipped..... | 5,265              | 6,996              | 7,503              |
| Nickel " ".....                       | 10,745             | 10,595             | 9,572              |
| Spot value of matte shipped.....      | \$4,628,011        | \$3,289,382        | \$2,930,989        |
| Wages paid.....                       | 1,117,420          | 1,278,694          | 1,286,265          |
| Men employed.....                     | 1,417              | 1,660              | 1,690              |

According to Customs returns exports of nickel in matte, etc., were for twelve months ending December 31, as follows:—

|                       | 1906       | 1907       | 1908.      |
|-----------------------|------------|------------|------------|
|                       | Pounds.    | Pounds.    | Pounds.    |
| To Great Britain..... | 2,716,892  | 2,518,338  | 2,554,486  |
| To United States..... | 17,936,953 | 16,857,997 | 16,865,407 |
|                       | 20,653,845 | 19,376,335 | 19,419,893 |

According to direct returns from nine plants comprising 16 furnaces, was 630,835 short tons, valued at 8,111,194, as compared with 651,962 tons, valued at 9,125,226 in 1907. These figures do not include the output from the two electric furnace plants, making ferro-products, which are situated at Welland, Ontario, and Buckingham, Quebec. Of the total output of pig iron during 1908, 6,709 tons, valued at \$171,383, were made with charcoal as fuel, and 624,126 tons, valued at 7,939,811, with coke.

The amount of Canadian ore, including mill cinder, etc., used was 219,266 tons, while the quantity of imported ore was 1,051,445 tons. The total amount of charcoal used was 1,121,990 bushels, valued at \$85,738. The quantity of limestone flux charged was 483,065 tons.

The plant of the Atikokan Iron Co., Ltd., was out of commission throughout the year, while a number of others were operated for a part of the year only. The blast furnace at Londonderry was in blast for little over a month, and the furnace of the Deseronto Iron Co., Ltd., for about two months.

**Iron and Steel Bounties.**—Following is a statement of bounties paid on iron and steel during the calendar year, as kindly furnished by the Trade and Commerce Department:—

|                                          | 1907.                              |              | 1908.                              |              |
|------------------------------------------|------------------------------------|--------------|------------------------------------|--------------|
|                                          | Quantity on which Bounty was paid. | Bounty.      | Quantity on which Bounty was paid. | Bounty.      |
|                                          | Tons.                              | \$ c.        | Tons.                              | \$ c.        |
| Pig iron made from Canadian ore.....     | 95,914.97                          | 201,421.47   | 101,647                            | 213,438.34   |
| Pig iron, made from imported ore.....    | 537,803.45                         | 591,583.80   | 517,427                            | 569,166.93   |
| Total, pig iron.....                     | 633,718.42                         | 793,005.27   | 619,074                            | 782,628.27   |
| Steel ingots.....                        | 666,589.87                         | 1,099,873.37 | 556,289                            | 917,876.63   |
| Steel wire rods.....                     | 68,738.22                          | 412,417.26   | 49,630                             | 297,778.68   |
| Total bounty paid on iron and steel..... |                                    | 2,305,295.90 |                                    | 1,998,283.58 |

**Steel.**—The returns for the year from eight companies making steel showed a total output of ingots and castings of 588,763 short tons, valued at \$9,233,602, as compared with 706,982 tons, valued at \$15,612,590, from seven companies in 1907.

**Asbestos.**—Returns of shipments of asbestos from the Eastern Townships, Province of Quebec, were received from twelve operating companies who employed 2,643 men in mine and mills and paid in wages \$1,002,768. Several other companies were engaged in development work and preparing to make shipments during the coming year.

The total shipments divided into crude and mill stock were in 1907 and 1908 as follows:—

|                                 | 1907.  |           | 1908.  |           |
|---------------------------------|--------|-----------|--------|-----------|

**Coal and Coke.**—Each of the coal mining provinces, except British Columbia, contributed an increased out-

put to the coal production in Canada in 1908. The total sales and shipments of coal, including colliery consumption and coal used in making coke, were 10,904,466 short tons, an increase of about 5 per cent. as compared with 1907. Of the total, Nova Scotia contributed over 59 per cent., Saskatchewan and Alberta over 19 per cent., and British Columbia 21 per cent.

The production by provinces was approximately as follows, the figures, of course, being still subject to correction:—

| Province.             | 1907.             |            | 1908.             |            |
|-----------------------|-------------------|------------|-------------------|------------|

| Total.....            | 10,511,426        | 24,381,842 | 10,904,466        | 25,567,235 |

\*No production reported.

The total production of oven coke in 1908 was approximately 865,257 short tons, valued at \$3,668,974, being an increase of about 3 per cent. over the quantity produced in 1907. The coke was made in the provinces of Nova Scotia, Alberta and British Columbia, and entirely from Canadian coal. At the end of the year there were in Nova Scotia about 659 ovens in operation and 173 idle, and in Alberta and British Columbia on the same date 916 in operation and 528 idle, not including the ovens at Hosmer and Comox in British Columbia, from which no returns have yet been received.

**Petroleum and Natural Gas.**—The production of crude petroleum is as usual practically all derived from the Ontario peninsula. Direct returns from the producers have not been obtained, but the production has been estimated on the basis of the bounty of 1½ cents per gallon paid by the Dominion Government. The total bounty paid in 1908 was \$277,193.21, representing a production of 527,987 barrels, compared with a bounty of \$414,157.89 paid in 1907, representing a production of 788,872 barrels. A decreased production of 33 per cent. is, therefore, shown.

Natural gas was produced in the counties of Welland, Halidimand, Norfolk, Kent, Essex and Bruce, in Ontario, and at Medicine Hat, Alberta; the sales from the Ontario fields constituting over 95 per cent. of the total.

The total receipts from gas sold in 1908 show an increase of about 24 per cent. over the receipts of 1907, and are now larger than at any time since the gas was first used.

**Portland Cement.**—Complete statistics of cement production in 1908 have been received from twenty-three operating plants.

The total quantity of cement made was 3,495,961 barrels, as compared with a total of 2,491,513 barrels made in 1907, showing an increase of 1,004,448 barrels, or over 40 per cent.

The total sales were 2,665,289 barrels, as compared with 2,436,093 barrels in 1907, an increase of 229,196 barrels, or over 7 per cent. The total daily capacity of the 23 plants was about 27,500 barrels, as compared

with an operating capacity of 14,300 barrels in 1907. The operating plants were distributed as follows: One each in Nova Scotia, British Columbia and Manitoba, the latter manufacturing a natural Portland, two in Alberta, three in Quebec Province and 15 in Ontario.

Of the 23 operating plants, 12 use marl and clay, ten use limestone and clay, and one blast furnace slag.

The average price per barrel at the works in 1908 was \$1.39, as compared with \$1.55 in 1907.

The imports of Portland cement into Canada during

the 12 months ending November, 1908, were 1,600,934 cwt., valued at \$530,209.

This is equivalent to 457,408 barrels of 350 pounds at an average price per barrel of \$1.16. The imports in 1907 were equivalent to 672,630 barrels, valued at \$837,520, or an average price per barrel of \$1.24½. The duty is 12½ cents per 100 pounds.

There is very little cement exported from Canada; the consumption is, therefore, practically represented by the Canadian sales together with the imports.

| Asbestic.....           | 24,011 | 34,666      |

Pig Iron.—There was 5,989 gross tons of charcoal pig iron valued at \$171,286 manufactured during the year.

The above figures show the value of the product at mine or at nearest shipping point.

## PROPOSED B. C. MINING LEGISLATION.

On February 18th the Hon. Richard McBride, before the B. C. Legislature, introduced a bill to amend the Coal Mines Regulation Act. The bill has to do with coal miners' certificates of competency. It provides that these certificates shall be granted by a board of three. Each board shall consist of one member appointed by the Lieutenant-Governor in Council; one member, with two alternates, appointed by the manager or managers of the colliery; and one coal miner,

with two alternates, actually working in the colliery and possessed of certificates of competency as such. The last member of the board shall be elected by the coal miners working in the colliery. The board will hold office for one year. Boards are to be appointed for each colliery which the Lieutenant-Governor in Council may designate.

Two other bills were introduced by Mr. McBride, one to amend the Companies Act, to the effect that free miners' licenses may be issued to companies; and another to amend the Placer Mining Act, to give the Gold Commissioner power to extend the limits of a claim of bench or dry diggings beyond the limits of the bench or dry diggings, but not to extend 250 square feet.

### MINERAL PRODUCTION OF ONTARIO IN 1908.

\$8,513,962 00

Add metallic ..... 16,705,647 00

Total production .....\$25,219,609 00

The figures given are subject to revision. Values are computed at the selling prices at the mines or works, and in the form in which the substances are produced.

As compared with 1907, there has been a considerable increase in the output of metalliferous mines and

works, and a shrinkage in the non-metallic production, the aggregate for 1908 being about \$200,000 in excess of that for the preceding year.

The falling off in the non-metallic list is mainly in crude petroleum and building materials. The new oil field in Kent County showed a greater proportionate diminution in yield than the older fields in Lambton County. The output of natural gas was materially greater than in 1907.

The silver mines of Cobalt yielded 9,000,000 ounces more than in 1907, but owing to the fall in the price of silver the value was not correspondingly greater. Shipments from the silver mines amounted to 24,485 tons. A little less than a third of the total tonnage was treated in Canadian reduction works, most of the remainder going to the United States, and a small amount to Europe. The ore treated at home was largely high-grade, the lower qualities being sent mainly to smelters in the United States, where they have been found suitable for mixture with other ores.

The nickel and copper output for 1908 was about the same as in 1907, but the valuation is lower.

### PRELIMINARY NOTE.

In a forthcoming issue of the Canadian Mining Journal, Mr. J. W. Evans' work in electrometallurgy will be described. This brief note is published now as a foreward.

In April, 1904, Mr. J. W. Evans undertook to apply electric smelting to the titaniferous and sulphurous iron ores of Hastings County. In August of that year he obtained the first steel directly from iron ores in Canada, and shewed a sample to Dr. W. G. Miller in Toronto, who advised continuing the experiments on a larger scale.

Accordingly, during the next winter Mr. Evans built a 2,000 kw. alternating current generator and exciter, the power supplied to run them being furnished by a 5 h.p. gasoline engine.

From September, 1905, to January, 1906, several pounds of high-grade titanium steel was smelted directly from the titaniferous iron ores, and about the same quantity of mild steel from the sulphurous iron ores of Hastings County. These experiments were described in a paper read before the Quebec meeting of the Canadian Institute in 1906.

Mr. Evans has a larger furnace now under construction, capable of smelting 25 lbs. of steel at a charge, and he expects to have it running before the middle of April.

Mr. Evans has also obtained a high grade of steel from iron sands in this furnace. No briquetting is required, as the sand is fed to the furnace in the fine state, and there is no blast to interfere with the feed. There are large deposits of ferrous sands in Ontario and Quebec, the cost of concentrating which is far below the cost of mining and grinding ore.

Titanium steel is being used more extensively every day, and it is only a question of time till the titaniferous ores of Ontario and Quebec will be used for steel-making.

# THE MINING OPERATIONS OF THE DOMINION COAL COMPANY.

By F. W. Gray.

(Continued from issue of Jan. 1, 1909.)

## THE EMERY SEAM AND LOWER SEAMS OF THE GLACE BAY BASIN.

### Chapter V.

The Emery Seam is found below the Phalen at depths varying from 160 to 180 feet. It averages from 4 feet 6 inches to 5 feet in thickness, but it has been found as thin as 1 foot 6 inches, and it is stated, although the fact cannot be given as a certainty, that the seam thickened out to 11 feet near Schooner Pond. Generally speaking, it is more irregular both in thickness and in depth than is usual in the seams of this Basin. The coal is harder than that of the thicker seams which overlie it, and will stand handling better. The analysis shows a high percentage of fixed carbon and although the ash contents are higher than the Phalen coal, it makes an excellent house or steam coal. The heating value approaches 14,000 B.T.U.'s. Twenty-five years ago the coal bore an excellent reputation as a steam coal, for which purpose, judging from the analysis, it seems to be specially adapted.

The measures immediately above the Emery are extremely rich in fossil remains. Some of the best fossils that have been found in the Sydney Coal Field have been taken from the roof of this seam, and whenever a shaft has been sunk to it the presence of characteristic fossils has told the seekers that Emery Seam was not far below.

The seam was first worked at the Acadia Colliery, Schooner Pond, about midway between Big Glace Bay and Cow Bay. The principal in this Company was Mr. Ross, who opened up a level from the shore in 1863. For some time the seam was known as the Ross Seam, but it afterwards came to be referred to as the Emery Seam, and it is stated to have been so named after Dr. Emery, of Boston, a director of the old Glace Bay Mining Company. As before stated, the seam was thicker at Schooner Pond than it has been found to be elsewhere. The property was afterwards acquired by the Glasgow & Cape Breton Coal & Railway Company, who built a narrow gauge railway from Schooner Pond to Sydney Harbour. Later the mine was taken over by the Sydney & Louisburg Coal & Railway Company, and passed from them into the hands of the present owners. Very little coal has been taken out of the seam at this point. From 1866 to 1872 the mine did not work; from 1872 to 1879 it was worked intermittently, and was closed in the last-named year, and has not since been re-opened.

The seam was also opened at Reserve Mines in 1873 by the Cape Breton Coal & Railway Company, who drove slopes from the outcrop. Between 1873 and 1875 the mine produced about 56,000 tons before it was closed down. When the property came into the hands of the Sydney & Louisburg Coal & Railway Company they drove a steeply dipping cross-measure drift out of the Main Slope in the Phalen Seam, cutting the Emery Seam at the extreme dip of their areas and worked the coal to the rise. In 1885 they sank a stapple pit from the Phalen to the Emery workings for purposes of ventilation. Working was once again

discontinued, and again recommenced in 1891. When the Dominion Coal Company took over the property in 1893 their policy was to work the thicker and more profitable seams, and along with several others the Emery Mine was closed.

In 1899 the Dominion Coal Co. sank slopes from the outcrop of the Emery Seam near the bankhead of the present No. 3 Colliery. The slopes were driven down for 1,600 feet, and were abandoned in 1901. They are now full of water. These workings were known as No. 4, a name which still survives in the nomenclature of the post office, to the bewilderment of passengers on the tram line, who are generally directed to alight at "No. 4" if they wish to go to "No. 3."

In 1905 the Company once more decided to operate the Emery Seam, and they pumped out the old workings at Reserve. The coal was first taken out by way of the old stone drift and disused main slope of the Phalen Seam on to the old bankhead, which was afterwards burnt down. The stapple pit before referred to was used to lower men in order to avoid the necessity of their travelling the steep drift. In 1906 a shaft 169 feet deep was sunk to the Emery Seam close by the old bankhead; a connection was made with the workings below the drift by headings driven from both ends, which met successfully. Coal was first hoisted from the new shaft in July, 1907. The output from this seam was 47,518 tons in 1906, 100,617 tons in 1907 and 163,000 tons in 1908. At the present time the mine (known as Dominion No. 10) produces 800 tons per day. In the beginning of the 1909 season it is anticipated that No. 10 will have an aggregate in the various levels of 5,000 feet of longwall face, and will reach the maximum output that it is expected to produce, namely, about 1,000 tons per day.

The surface equipment of the colliery is small, as it is served by the same power plant as No. 5, the coal being dealt with on a common bankhead which was previously referred to in the description of No. 5 Colliery (Reserve).

The coal hoist is a double, slide-valve, horizontal engine, cylinders 20 inches by 42 inches, made by the Jenckes Company. The hoisting rope is  $1\frac{1}{4}$  inches in diameter passing over 12 ft. pulleys. The headframe is similar to that described at Dominion No. 7. The cages are 15 ft. 10 in. long by 7 ft. 9 in. high, and take two cars at a trip. The cars are pushed in and out of the cage in the same manner that was described in the reference to International Colliery. The shaft is rectangular, timbered with buntons 8 inches square, spaced every 4 feet and lagged behind with 3-inch scantlings.

The underground haulage is endless rope, operated by clutch gearing from the same engine that drives the French Slope rope in the Phalen Seam. The rope used is 1 inch in diameter and 6,000 feet in length. The mine cars are of special design for the low seam. They are 6 feet 4 inches in length, 2 feet 8 inches from the rail to the top of the box and 3 feet 6 inches wide. They weigh, empty, about 580 lbs.

The coal is undercut by rotary-disc coal-cutters

worked by compressed air. The mine is equipped with nine of these machines of the "Diamond" type, one of the special features of which is that it dispenses with rails and jigs itself along the pavement on a steel sled. Two of the machines cut 4 feet 6 inches under; the others have a larger wheel, and make a 5 feet 6 inches undercut. The coal is blasted down, the explosive used being "Rippite." Pneumatic machines are used in the development work.

At the present time the gate roads are spaced 40 feet apart, but the management are endeavoring to get them 80 feet apart, and more if possible. The horses are now taken up the gates to the face, but as the workings advance it will not be possible to continue this. The pitch of the seam is not at present steep enough to admit of gravity planes being successfully worked, but it will be necessary as the workings advance to devise some method of mechanical haulage in the main gates. At the present time the Company are considering the purchase of longwall face-conveyor belts, which will take the coal along the face and deliver it at the head of the main gates, thus avoiding the necessity of taking the mine cars into the face and saving a certain amount of breakage. Machinery of this type is being successfully worked at the present time in Europe.

The workings are ventilated by a Stines fan 8 feet in diameter. A small air-shaft 30 feet deep was sunk from the surface in 1908 on to the main slope of the Phalen Seam, and the air for the Emery workings goes down the staple pit before mentioned. The pit bottom and the main approaches of the mine are lit by electric incandescent lamps, and safety lamps only are used in the workings.

The development of No. 10 to its present condition has been a slow and difficult process, owing to the method of extraction adopted. The native miners, and their fathers before them, have all been accustomed to working in high and dry seams, and to the "pillar and room" system of extraction, with its accompanying classification of labor, and they prefer to work in these seams so long as it is possible. The Coal Company have been compelled to import miners used to the longwall method from European mining countries, where this mode of extraction is general. A large proportion of the miners in the Emery are from Belgium, and there are quite a few workmen from Middle Europe. Conversation therefore in the workings is occasionally a little mixed.

**The Lower Seams.**—The thickness and characteristics of the Emery Seam adapt it for extraction by the longwall method, which is a comparative novelty in Cape Breton. This mode of extraction has been tried on a limited scale at the Gardiner, the Gowrie, the Victoria Mines and, of course, in the Emery itself. What is true of the Emery seam is also true of all the lower seams in the Glace Bay Basin. In the longwall extraction of coal the seam is taken out in one operation by successive slices along an extended portion of the seam. The haulage-roads, air-roads and general means of communication through the waste or goaf, that is, through the territory where the coal has been extracted is maintained by building pack-walls to support the roof. These packs are constructed in the same manner as the dry stone walling which one sometimes sees on the surface. The thick seams of the Glace Bay Basin, which up to the present time have been worked to the practical exclusion of the thinner seams, have all been extracted on the "short-wall," or what is better known

as the "pillar and room" system. In this mode of extraction a square of coal is extracted, and a square is left to support the roof. The plan of the workings of such a mine resembles therefore a checker-board, the alternate squares representing solid coal and goaf. A seam such as the Phalen or the Hub, which consists of from 7 feet to 9 feet of clear coal without any dirt bands, cannot be worked by the long-wall system, as the seam contains no waste material that can be utilized to pack the roads and the goaf. In the thinner seams the roof has to be taken down in the roads to make height for the men and the horses; a process that has to be repeated from time to time as the superincumbent strata presses down to fill up the vacant space left by the extraction of the coal seam. This roof stone and the stone that is taken down in the faces will provide sufficient material for packing the goaf and maintaining the gate roads. As previously mentioned, it is probable that the Emery and all the seams below it will be mined altogether on the longwall system of coal extraction.

Below the Emery Seam are to be found the Lorway Seam, Clarke Seam, Martin Seam, and the Mullins Seam. None of these have been worked to any great extent, and the most valuable portion of all of them is included within the areas of the Dominion Coal Company. In looking over a map of the leases of coal areas in the Glace Bay Basin, one cannot help but be struck by the wisdom with which the areas of the Dominion Coal Co. are chosen, as they include the most valuable portions of all the coal seams; and it is no exaggeration to state that the seams not included within the leases of the Dominion Coal Company are seams which cannot be worked with profit in the present state of the coal trade, or in competition with the Coal Company.

Referring to the section of the coal measures which is given in the description of No. 2 Colliery, it was pointed out that from the Hub to the Lorway Seam, the measures hold nearly 40 feet of coal in a total depth of a little over 1,300 feet. The lowest of the workable seams is the Mullins Seam, and, judging from the data of the Geological Survey, it will be found about 1,400 feet below the Gardiner Seam, or at a total depth from the surface at No. 2 of from 2,700 to 3,000 feet; so that in the land area of the Glace Bay Basin the Coal Company have all the seams within workable limits of depth. However, until the thicker and more profitable seams which the Company own in the land and submarine areas of the Glace Bay Basin, and in their magnificent property in the Langan-Victoria areas (which will be later referred to in detail) approach exhaustion, it is not probable that anything below the Lorway Seam will be worked. As the collieries on the Phalen Seam, such as Reserve, Caledonia, and in fact all the older collieries, become depleted, the present plant will doubtless be used for mining the Emery and the Gardiner (or Lorway), and the life of these collieries may be considered for the purposes of the present generation as indefinitely prolonged.

We may expect in Cape Breton as time goes on the same appreciation in the value of coal fields as has taken place in older countries. In England, for example, the thicker seams, such as the Barnsley Bed in South Yorkshire, and the Thick Coal in South Staffordshire, are rapidly being worked out, and seams are now being mined which were at one time entirely neglected. By the use of coal-cutting machines, electric power transmission, longwall face-conveyors and the general improvements in mining practice afforded by modern

equipment, it has been found possible to successfully and profitably mine coal-seams that do not exceed 16 inches in thickness. When it is considered, therefore, that there are in the Glace Bay Basin not less than six seams of coal practically untouched, which are each over three feet in thickness, and that in addition to this the Coal Company's submarine leases in the Glace Bay Basin, the Lingan-Victoria tract and near Point Aconi, in the Sydney Mines Basin, are as yet almost virgin, it will be seen that there is not yet any need for anxiety as to the coal resources.

The amount of information that is available with reference to the lower seams is extremely meagre, and very little more is known about them at the present time than is contained in the transactions of the Mining Societies and the writings of Mr. Richard Brown, which are dated in the 'seventies. This fact is in itself a commentary on the previous remarks, for with such large resources actually proved and within sight it has not been thought necessary to do much prospecting.

seven workable seams of coal situated inside the productive coal measures. The edge of the Millstone Grit lies one and a quarter miles inland along this line, and proceeding further, the Mullins Seam is met with at a distance of two and a quarter miles from Low Point.

Following the seams along the coast from the Bridgeport Anticline, they are found to dip at an average angle of 10 degrees until the Barachois Pond is passed. On the eastern side of Low Point the dip is 15 degrees, and increases through a distance of three-quarters of a mile to 24 degrees on the western side. The rapid increase in the dip continues until at the point where the Victoria Seam passes under Sydney Harbour, two and a quarter miles distant from Low Point, the seams are inclined at a maximum angle of 40 degrees. At the shore-crop of the Mullins the dip has decreased to 30 degrees, and at South Bar, one and a half miles further up the Harbour, the inclination is once more 10 degrees.

## Chapter VI. LINGAN-VICTORIA AREAS.

This portion of the Sydney coal field has been less worked than any of the other basins, and its seams are to-day practically intact. The whole of the coal seams in the territory shown on the accompanying sketch map are under lease to the Dominion Coal Company, as the direct successors of the General Mining Association, and they constitute a magnificent asset.

The western boundary of the field is a disturbance of unknown extent under the waters of Sydney Harbor. The eastern limit is the Bridgeport Anticline. From the point at which the crops of the coal-seams disappear under the waters of Indian Bay, or, as it is some times called, Lingan Bay, to where they are visible on the shores of the lower reaches of Sydney Harbor, measures seven miles. About midway in the sweep of the seams is the flat promontory of Low Point. A line drawn inland from this point will cross the outcrops of

The disturbance previously referred to, which undoubtedly exists under the Harbor between the coal seams of Lingan-Victoria and those of the Sydney Mines Basin, is in all probability the continuation of the synclinal fold underlying the northwest arm of Sydney Harbour. The indications afforded by the configuration of the shores of the Harbour from South Bar to Low Point and the rapid increase in the dip of the seams on the Victoria shore compared with the regular dip of the seams at Sydney Mines and the undersea workings of the Nova Scotia Steel & Coal Company on the other side, suggest that the disturbance lies very close to the eastern shore of the harbour, and may be accompanied by faulting.

The relation of the seams in the two foregoing basins has for a good many years been an interesting subject for speculation, and one which presents a good many difficulties. The relation of the Lingan-Victoria seams to those of the Glace Bay Basin does not, however,

present such difficulties, as will be seen from a study of the following sections:—

| Lingan-Victoria. |               |              | Glance Bay.  |          |

| Mullins .....    | 6' 0"         |              |              |          |

It is usual to give two sections of the Lingan-Victoria seams for the reason that there is a large differ-

of the country between the outcrop of the 2 feet 8 inches seam, or Emery, and the outcrop of the lowest seam of all, namely, the Mullins. If the above correlation of the seams as yet unproved lying between the outcrops of the two seams last mentioned.

The only two seams that have been worked to any extent are the Lingan Main and the Victoria Seams, and the total yield of the whole coalfield as far back as records extend has not exceeded 2,000,000 tons.

The Lingan Main Seam was opened by the General Mining Association in 1855, and a short railway was constructed about a mile in length to a small harbor in Indian Bay. The mine appears to have closed down about 1885.

The Victoria Seam was first operated by the Victoria Company, who opened a mine in 1865 to work submarine coal areas under Sydney Harbour. The slopes were driven on the property of the G.M.A., who owned the land area. At that time the "Victoria" seam was known as the "Ross." From 1878 to 1883 the mine was idle, and was taken over about 1884 by the Lingan and Low Point Coal Company, from whom it passed into the hands of the Dominion Coal Company. They continued to work the seam vigorously until 1897, when the workings were abandoned in accordance with the policy of concentration which was being followed at that time. As successors of the former owners, the

Large Reservoir, showing Dam and Miners' Houses under construction—Reservoir capacity, 7,200,000 gallons.

ence between the measures on the Lingan side compared with those on the Victoria side. There is not, however, any very marked variation in the seams themselves, although in one case, that of the Lingan seam, a small parting thickens out until it separates one seam into two, but there is a general thickening of the measures between the coal seams as they approach the Victoria side. Mr Richard Brown, in commenting on this, writes: "The thickness of the intervening strata in the Low Point is nearly four times greater than in the Lingan section—a phenomenon by no means unusual in almost every coal field where the persistency in the coal seams exceeds that in the sedimentary strata with which they are associated."

The section just given is a representative one, and gives a fair idea of the number of workable seams which are present in this tract. The equivalents of the four best known seams in the Glance Bay Basin, namely, the Hub, Harbour, Phalen and Emery seams, are all present. Altogether there are eight seams at least which are workable, but taking the conservative figure of 20 feet of workable coal in the best seams only, it is estimated that these areas should yield approximately 400,000,000 tons. It should be taken into consideration that as yet practically nothing is known

Dominion Coal Company own the railway right-of-way and the old Victoria shipping pier shown in the sketch.

The General Mining Association also proved the Barachois Seam by driving slopes from the surface near the Barachois Pond, but no coal appears to have been shipped from this point.

The settled portion of this coalfield consists of a narrow strip of cultivated land skirting the coastline, between the sea and a wooded hinterland. The farmers and fishermen who constitute the population are mostly the direct descendants of the original settlers, and some of them can relate interesting reminiscences of those more primitive days. Irish names predominate, and are well represented in the nomenclature of the seams, as instance such names as Dunphy, Keefe, Carr, McNeil and McGilvray, not to mention the "Phalen" on the other shore. It is supposed that the word "Lingan" is a corruption of the French words "l'Indien," and this assumption is corroborated by the fact that the neighboring arm of the sea is called Indian Bay. The word "Barchois" is a very common one in Cape Breton. It is no doubt of French origin, and is usually given to a small salt-water lagoon almost, but not entirely, separated from the sea by a low sandbar. It has been suggested that the original spelling of the

word was "barre-a-choir," from "barre," a sandbar, and "choir," to fall away, or an opening in the bar. The word is sometimes spelt "Barasois," but doubtless this is a corruption.

In the summer of 1907 the Coal Company decided to open new collieries, and did a large amount of preliminary prospecting work. They finally determined

eral development of Dominion No. 12 as it is was at the end of 1908. The work of construction is now going on and the description is necessarily incomplete, as all the details have not yet been finally worked out.

The site of the colliery is well chosen, and has been cleared out of an almost completely wooded country. It lies near the stream known as Irish Brook, which

Dominion No. 12—General View of Colliery in December, 1908.

upon opening a slope mine on the Victoria Seam not far from Barachois Pond, and another opening on the same seam about a mile to the eastward. These two collieries are named respectively Dominion No. 12 and No. 14. Another colliery, to be called No. 15, is projected on the Lingan Main Seam, but the site is not as yet definitely decided upon.

**Victoria Seam, Dominion No. 12.**—This seam is supposed to be the equivalent of the Harbour Seam of the

forms the Barachois Pond at its mouth. Near the colliery this stream runs through a ravine, and by a slight expenditure on an earthen dam an adequate water supply has been obtained, which will supply the demands of this group of collieries for some time to come.

At the end of 1908 the slopes were driven in from the surface for a distance of 1,600 feet, and it is anticipated that by the summer of 1909 sufficient territory

Dominion No. 12—General View taken in December, 1908, Shows bankhead framework, foundations in the forefront and miners' houses in the background.

Glace Bay Basin and of the Main Seam of the Sydney Mines Basin. When it was mined by the old Victoria Company the coal had an excellent reputation, which the present product seems likely to uphold. The coal is low in ash, very free burning and does not clinker.

Following is a description of the plant and gen-

will have been opened out to give a daily output of 500 tons. The equipment of the colliery is designed to deal with from 1,000 to 1,200 tons per day, a capacity which will in all probability be reached by the shipping season of 1910.

The seam as proved at No. 12 and No. 14 is 6 feet 7 inches in thickness, and is pitching at an average rate

of 22 per cent. The pitch was very much steeper at the edge of the crop, but flattens out as it goes farther to the deep both at No. 12 and No. 14 slopes. The workings are laid out to take advantage of the pitch of the seam, and the coal will be worked uphill from the levels by rise "balances" or gravity plane-haulages. The pillar and stall method of extraction will be used; rooms, 20 ft. wide; pillars, 20 ft. by 70 ft., and levels every 450 feet. Mechanical haulage will be used along the levels worked by a small winch at the end of each level. Trip haulage will for the present be used on the main roads. The workings are, however, being laid out with a view to the possible introduction of endless haulage at a later date. The style of pit tub adopted is not so large as is usual in the Glace Bay Mines, owing to the heavier pitch in the Lingan areas. The tub is 5 feet 8 inches long by 3 feet 2 inches wide by 2 feet inside depth, over-all length 6 feet 10 inches, capacity 2,240 lbs., rail gauge 2 feet 6 inches. At the present time the seam is being worked by hand-picks. Mining machines will be put in later, and the type chosen will,

of course, depend largely upon the power system which is adopted.

The form of power that is to be used in the group of collieries now being described is not yet definitely decided upon, but it is very probable that they will be operated by electricity. A proposal is being considered to install exhaust steam turbines at Dominion No. 2 Colliery, and to generate electric power there for transmission to the Lingan collieries, but this proposal is not at the present time sufficiently matured to enable a definite statement to be made.

At the present time there are two 250 h.p. Babcock & Wilcox boilers in a temporary house. The permanent boiler-house is not yet erected, and it is not yet definitely decided how many boilers are to be laid down. When the house is built it will be of brick and steel construction, similar in design to the one at No. 6 Colliery.

A temporary air compressor is being run to work the underground pumps. The permanent compressors are not yet purchased.

(To be continued.)

## EXCHANGES.

**The Mining World, February 20, 1909.**—Arthur Lakes, in an article entitled, "The Many Varied Occurrences of Ore in Veins," writes of the widely diverse manners in which ores of the precious metals occur. "Any cavity, opening, or weak zone in the crust of the earth, formed by whatever agency that is susceptible of being filled or saturated by waters carrying vein and metallic solutions, is capable under proper conditions of depositing ores and becoming an ore body. Obviously the nature and appearance of these openings must be very varied." Mr. Lakes then goes on to discuss the so-called true fissure vein.

**The Engineering and Mining Journal, February 27, 1909.**—Nevada gold camps have provided world's records in high-grading. Mr. Mark R. Lamb, in this number of the E. & M. J., narrates a few picturesque incidents of ore-stealing in the Goldfield camp. One of these narrates how a miner, seated on the curb in front of a bank, requested the assistance of a passerby. The miner explained that ore, not whiskey, was his load. From the crown of his Stetson to the top of his boots he was laden with specimen ore.

Apparently there was no difficulty in disposing of stolen ore and bullion. The owners of one mill advertised openly to buy bullion. They were known to have bought from their own employees bullion that was stolen from their own mill.

**The Iron and Coal Trades Review, February 19, 1909.**—After summing up briefly the Privy Council decision in the appeal of the Dominion Coal Company, the Review concludes its editorial thus: "Their Lordships dismissed the appeal, with costs. . . . The effect of this is that the Steel Company obtain full damages, as they will be assessed by the Canadian court to whom the question of amount is remitted; they do not obtain fulfilment of the contract. . . . The case affords another instance where the conditions of a contract of

great importance are left to a few loose words of quite extraordinary elasticity. That may be an advantage sometimes; but for a steel company of this importance to contract for 'all the coal it may require for use in its own works,' without anything to show that it was for steelmaking, is surely exceptionally open wording."

**The Engineering and Mining Journal, February 20, 1909.**—A synopsis of an address delivered by Dr. James Douglas, at Biska, Arizona, appears in this issue. The address is a resume of the history of the Copper Queen Mine. Dr. Douglas went out to Arizona in 1880, to look at what has since proved to be the Verde mine. Being disappointed in this prospect, he visited, with his friend Riley, the only mine then opened in the district, the Copper Queen. This was early in 1881. The mine throughout August and until January, 1882, yielded ore carrying 20 to 25 per cent. copper. In spite of mining men's prejudice against copper ores that occurred in limestone, Dr. Douglas was strongly in favour of purchasing the mine; \$10,000 was the price then asked. In the following year Dr. Douglas advised Phelps, Dodge & Co., to purchase the property for \$25,000, the price then asked.

Dr. Douglas refers to the transaction thus: "I gave them the opinion that if they were poor men and it would likely impoverish them to buy it, they had better leave it alone; but if they were in a position to throw their money away, to take it." When the new owners had got as far as the 400 ft. level the ore had cut out entirely. This was in 1884. Only three months supply of ore was left. Money also was scarce. Dr. Douglas and his friends determined to follow a little streak of ore on the Atlantic claim. The expenditure of a few thousand dollars brought them into "another glorious body of ore." The Queen, at the same time, encountered the same body. The Copper Queen Consolidated Mining Company was formed in August, 1885. Its good and evil times are vividly described.

## INDUSTRIAL PAGE.

The Nova Scotia Steel & Coal Co., of Sydney Mines, N.S., have recently ordered from the Robb Engineering Company, of Amherst, N.S., a 54-inch double inlet Sirocco mine ventilating fan, also a 125 h.p. Robb-Armstrong automatic engine for driving the fan.

On December 14th, 1908, a large gathering witnessed the first run of the new 1,000 kw. Belliss-Morecom engine which was installed at the Johannesburg municipal power station. The new engine is similar to two other large units in the power station. They were all built by Belliss & Morecom.

We have received from the Allis-Chalmers-Bullock Company, Montreal, a remarkably effective calendar. A striking picture of beavers at work has under it the legend, "The First Engineers." As the Allis-Chalmers-Bullock people are manufacturers of hydro-electric power machinery, this legend is most appropriate. The calendar runs from March, 1909, to March, 1910.

**Westinghouse Traction Brake Company, Pittsburgh.**  
**Instruction Pamphlet No. T. 5042, December, 1908.**

The electric pump governor is a device for controlling automatically the operation of motor-driven air compressors between predetermined minimum and maximum air pressures. The pamphlet, whose title is given above, describes types J and J-4. Type J is a governor for use with direct-current or single-phase alternating-current motor-driven air compressors. Type J-4 is used in industrial service, with two-phase (3 or 4 wire) or three-phase circuits, 100 volts to 550 volts, controlling compressor motors up to and including 15 h.p.

In the United States Circuit Court for the Northern District of Illinois the judge filed a decree in the case of the General Electric Company against the Morgan-Gardner Electric Company on Bassett patent 56792, granted March 20, 1894. This decree is the outcome of a suit brought by the General Electric Company to restrain the Morgan-Gardner Electric Company from the further infringement of the Bassett patent in the manufacture and sale of certain electric motors for use on electric mining locomotives. The court holds that the patent is valid and the defendant has infringed. The Bassett patent relates to a form of railway motor in which the field frame is diagonally split so as to allow ready access to the armature or interior parts of the motor, without removing the motor from the locomotive or car to which it is attached, and in which the parts are thoroughly protected from injury. The form of motor held to infringe in this case is the one which the Morgan-Gardner Electric Company has been selling for a number of years as its standard motor.

**The Hennig Concentrator. The Ore Dressing Machinery Co., 114-118 Liberty Street, New York.**

The Hennig Ore Concentrator embodies some new ideas in riffled tables. These ideas include the "Hennig" sinuously curved riffle, the substitution of an even reciprocal drive in place of jerking or bumping, and the introduction of a new motion to one portion of the

table, which, it is claimed, gives a greatly increased efficiency.

The base of the Hennig, consisting of two heavy 8-inch channels 14 ft. 6 in. long, rests upon three heavy cross-timbers, or may be directly set upon a concrete foundation. Three short 8-inch channels are riveted to the bottom of the long channels. These space the long channels accurately, and stiffen them materially. On top of the channels the eccentric drive and the two cradle supports are firmly bolted. The drive consists of a one-piece heavy casting containing three bearings. A double eccentric provides a simple and positive adjustment for the length of stroke from 0 to 15-16-inch in increments of 0.001 inch.

The table is 16 feet long by 7 feet wide. The deck is made of strips of clear white pine laid in white lead and placed diagonally. The most satisfactory covering has been found to be heavy canvas coated with asphaltum. Both covering and riffles are put on the table before shipment.

## CORRESPONDENCE.

March 8, 1909.

Editor Canadian Mining Journal:

Sir,—The article on "Our Visible Supply of Brick," by Professor Baker, in a recent issue, brings the practical side of the matter before us in an excellent way; but his Pleistocene geology is so different from our modern views on the subject that it is worth while to show what changes have been made in our knowledge of the Ontario pleistocene since the *Geology of Canada* appeared in 1863.

The old terms of Erie and Saugeen clays are no longer useful, since we know that the so-called Erie clay was laid down partly as boulder clay and partly in several glacial lakes. The term really includes clays of different origins, which should have different names, corresponding to the bodies of water in which they were formed.

The Saugeen clay is not of separate origin from much of the Erie clay. It is often only the shallow water deposit near the edge of a glacial lake, and connects up with blue Erie clay laid down in the deeper waters of the same lake. In other cases it is simply weathered Erie clay, from which the lime has been leached.

The statement that an ice dam was formed across Eastern Ontario through Perth, Ottawa, etc., about the middle of the glacial period, separating fresh water on the west from salt water on the east, is entirely incorrect. The ice dam which held in the fresh waters of Lakes Algonquin and Iroquois in Western Ontario occupied the whole St. Lawrence valley, leaving no place for salt water.

The enlarged Gulf of St. Lawrence did not cover Eastern Ontario till this ice dam was completely removed from the southern part of the province, so that the Leda clay is thousands of years later in origin than the so-called Erie clay, and was formed when the climate of Ottawa was the same as at present.

May the remark be made, in conclusion, that this criticism of the geology of the paper implies no reflection on its value from the economic side.

Yours truly,  
A. P. COLEMAN.  
Department of Geology, University of Toronto.

## SPECIAL CORRESPONDENCE

## NOVA SCOTIA.

## Glace Bay.

**Eight Hour Commission of Enquiry.**—During the past fortnight the Eight Hour Commission has continued its labors, interviewing and examining representatives of employers and workmen in the coal and iron industries around Sydney and Glace Bay. It is expected that a preliminary report will be given by the Commission at no distant date, to be followed by a more detailed publication.

**The United States Antagonist of the P. W. A.**—The executive of the U. M. W. of America has kindly sent down two of its agents to Cape Breton to assist in the squelching of the Provincial Workmen's Association of Nova Scotia. In the inception of this movement the agents of the American order posed as missionaries who having heard the Macedonian cry of oppression that rose from Nova Scotia were constrained to come to the aid of their distressful brethren. They have now thrown off this mask of pretence, and are publicly stating that it is their earnest hope that the P. W. A. is—as one of their speakers in Sydney put it—"a thing of the past." This same speaker expressed a pious wish, which we are sure must be re-echoed in every true Canadian bosom, that before very long the U. M. W. of America would "reign from Sydney to Vancouver."

The P. W. A. is, however, not willing to be classed with the dinothereum or the dodo. Some happenings in Glace Bay recently proved this very effectively. The two representatives of the U. M. W. of America just referred to announced a public meeting in the King's Theatre at Glace Bay, to which they invited members of the P. W. A. to listen to the gospel of freedom as it is in Pennsylvania interpreted by a gentleman from Kansas, U.S.A. The P.W.A. for once descended from its perch of reposeful dignity and decided to make a "demonstration." When the U. M. W. A. detachment arrived they found the theatre filled to the doors with about 1,000 members of that effete body—the P. W. A. As many of the enemy as found it feasible squeezed themselves into the theatre, and then the fun commenced. Both sides entered a contest as to which could howl the loudest, and it may be said that the Cape Breton miner has a gift in this direction. A scene of confusion ensued, and for the space of two hours the crowd vied with the Ephesians of old, finally breaking up in disorder. The honors were decidedly with the vociferous powers of the P. W. A. men. The lungs of the non-native elements which constitutes the large majority of the U. M. W. A. supporters cannot cope with the brazen throats of men whose ancestors said good-morning to each other across a Highland glen. So they gave it up. The scene was not edifying, but it served to show how incensed the native unionists are becoming against the interlopers who have come unasked and certainly unwelcomed from the United States, with the avowed intention of causing trouble where peace did reign.

There was a large crowd in the streets of Glace Bay on this occasion, and so tense was the situation that very little would have caused an ugly row. It speaks well for the self-control of these men that no breach of the public peace took place, and it further serves to show how inborn is the sense of order in the Canadian citizen. It was a well-dressed crowd also. Speaking as one who has lived among and seen mining populations in several European countries, we are bound to admit that the native miner of Nova Scotia need fear no comparison, in dress, physique, speech or brains with his foreign brethren. We apologize for the term "native" but use it to distinguish between the Canadian born population and the new-comers. Where the European miner goes abroad in hob-nailed boots, with a scarf around his neck and a cap on his head, the Nova Scotian miner

is shod with trim boots, protected by "rubbers" or overshoes. He wears a starched shirt, a "Derby" hat, and would not dream of appearing in the streets without a collar. He speaks the King's English more or less correctly, not in the uncouth gibberish that passes current for English in some place we wot of.

To any person who knows the conditions that attend the miner's life in the United States and in Europe it is quite incomprehensible that Nova Scotian men should wish to put themselves under the thumb of an alien organization, who wish to make catspaws of them and nothing more. Seeing that conditions in Nova Scotia to-day are far ahead of conditions in the land which owns these self-styled saviours of the people, we fail to see how conditions will be improved here. Rather, would we think they will be dragged down to the level of less favored lands than our own.

Take for example, the recommendations made by the group of European mining experts which were lately called in by the U. S. Government to report on the prevention of mine explosions. These recommendations might have been adopted in toto from the accepted practice of Nova Scotian mines. Look at the record of life lost by explosions in Cape Breton during the past half-century. The two greatest disasters were the Caledonia explosion in 1899 and the Port Hood explosion in 1908, which together caused the death of twenty-one men. During the fifty years in question, Cape Breton produced between sixty and seventy million tons of coal, so that the percentage of lives lost by mine explosions cannot be called large.

It is not altogether a matter of safer mining conditions either. It is simply because mining in Cape Breton is conducted on proper lines, with due regard to the safety of the workers. And until they can do things better in Kansas or Pennsylvania we consider it is cheerful gall for any person to come from there and pretend to teach us anything that pertains to either the practice or the economics of mining.

We have once before referred to the utterances of a representative of the U. M. W. A. who in the rink at Glace Bay told an audience of miners that he knew they worked in ill-ventilated mines and were only half-fed: "it was plainly marked in their pallid faces." This gentleman came from British Columbia where the fatal accident rate among miners is twice as high as it is in Nova Scotia. What are people called who do not tell the truth?

**North Atlantic Collieries, Limited.**—The new shaft which has been sunk on the area leased by this company, reached the Blockhouse seam on the 27th of February. The seam in the new winning is 9 feet 6 inches in thickness. This seam is correlated by the Geological Survey as being equivalent to the Harbour on the Glace Bay side of the Morien anticline, but its thickness and general characteristics so resemble the Hub Seam that many people prefer to think it is the same seam. A peculiar feature of this seam was referred to in the Transactions of the North of England Mining Institute as long ago as 1871 by John Rutherford, namely the irregular shaped masses of shale which are met with in the body of the seam. Mr. Rutherford says: "This peculiarity consists of masses of shale which intercept the workings in a very singular manner. They are occasionally several yards thick, sometimes they are wedge-shaped, running to a point at the bottom of the seam, and are often of the most fantastic forms. From the fact of there being a bed of shale over-lying the coal, and also that in only one instance are they connected with the floor of the seam, it appears reasonable to infer that they have been thrust into fissures in the coal; but how these have been caused without disturbing the general shape of the beds is not so evident."

## QUEBEC.

**East Broughton.**—The Quebec Asbestos Company's property has been purchased by New York capitalists. Mr. Ling is president of the company which will be known as the Ling Asbestos Company. The Frontenac Asbestos Company have completed their mill and are now installing machinery. The Shawinigan Power line has been extended from Thetford Mines to East Broughton and will supply most of the power used at the mines.

**Black Lake.**—Mr. R. T. Hopper, of the Standard Asbestos Co., lately purchased from King Bros, Limited, lot 28, range 6, Ireland. The Q. C. Ry. Station and a considerable portion of the town are located on this property. The Imperial Asbestos Co. has taken up part of block "A" in Coleraine and propose building a mill in the early future. The property was bought from Mr. J. N. Greenshields, Montreal, who is the vice-president of the new company.

**Danville.**—The Asbestos and Asbestic Co., Limited, last year produced the largest tonnage in their history, approximating twenty thousand tons. A new mill is under construction which will increase the milling capacity by a half.

**Thetford Mines.**—Mining business has been very quiet here since the new year, and it is not probable that there will be much activity before the first of May. The building of new plants and enlargement of the old ones indicate a busy season. In 1894, at the close of a depression similar to the present, there was little latent confidence, while to-day there is a genuine boom in mining sales and exploitation. Messrs. W. Raleigh Kerr, J. A. Jacobs, and Mortimer Davis have purchased lot 28, range 6, Thetford, and are commencing at once to build a four "cyclone" mill. The company is called the Thetford Asbestos & Exploration Co. The Robertson Asbestos Co. are progressing favorably with the erection of their mill and hope to have it in operation in May.

## ONTARIO.

**Cobalt.**—One of the latest districts to attract the attention of the prospectors is the Township of Morel. Many hundreds of claims have already been staked and several good silver finds are reported. The new district is situated about thirty-seven miles to the northwest of Elk Lake, and in summer is accessible by canoe, on the east branch of the Montreal River.

The timber question in Gowganda has given rise to a great deal of dissatisfaction. Cutting timber is strictly prohibited by the Government, and offenders are being severely dealt with. The saw mill which was started some time ago has been forced to close down. The difficulties arise out of the fact that the discoveries are located in the Forest Reserve.

One of the most important finds of the year at Gowganda has recently been located on the Mann claim. The rich vein of the Boyd-Gordon has been traced to the former property and stripped for considerable distance. Excellent showings of native silver are reported to have been found.

A syndicate, composed of Detroit men, has purchased sixteen claims in Gowganda for \$50,000. A gang of twelve men has been sent up to do the assessment work.

The Bannell Sawyer, one of the big operators of the Larnder Lake Camp, has acquired the Milne property, known as T.R. 108, adjoining the Mann and Armstrong property in Gowganda.

On the claim owned by Col. Hay at the south end of Silver Lake, Montreal River District, a force of twenty men are engaged doing development work. On the 50-foot level of the old shaft, a drift is being driven on a 5-inch vein of calcite, carrying quantities of smaltite and niccolite.

The Toledo Mines Co. operating in the northwest corner of Tudhope Township, has purchased a plant consisting of a boiler, a six-drill Sullivan compressor, hoists, drills, etc., and at the mine everything is being put in readiness for the installation of the machinery, as soon as it arrives. A contract has been let for sinking a shaft 60 feet deep and as soon as the plant is in place this working will be taken over by the company. So far only temporary camps have been erected on the property.

The Bradshaw properties in the northwest corner of Tudhope Township will be operated by a company known as the United States Silver Mining Co. with a capital of \$1,000,000. A contract has been let to sink two shafts, each 100 feet in depth from the bottom of which drifting will be carried on. Permanent camps are being constructed and it is expected that machinery will shortly be installed.

The Big 6 Mining Co. recently sold four of their claims in the Miller Lake District to a syndicate. On their property adjoining the Motherlode Mine, considerable development work is being done. A shaft is down to a depth of 75 feet on a well-mineralized vein of calcite and a contract has been let to sink 25 feet more, at which depth drifting on the vein will commence.

There is great activity in the townships of Corkill, Brewster and Charters, Montreal River District. The recent discoveries at Calcite Lake have attracted the attention of a large number of prospectors. Several good discoveries are reported.

The system of leasing in this camp is rapidly gaining prominence, and the recent developments at Peterson Lake show that this method gives good results. The Little Nip, the Kerry Mining Co., and the Lucky Seven, are among the most important leasers, and the work done by the Lucky Seven, with the diamond drill has given such good results, that a small plant will probably be installed, and active development work carried on. The Kerry Mining Co., are still sinking on the 2½-foot niccolite vein discovered some time ago at a depth of about 95 feet. Sinking will be continued to the 150-foot level when drifting will commence. The vein has widened to 4 inches and carries good values.

The Bridge Syndicate, operating on Peterson Lake, have purchased a plant consisting of the following: One 100-h.p. boiler, the first half of an eight-drill compressor, a hoist, and three drills. The machinery has been shipped and will be installed early in March.

The Silver Mountain property has been leased to Mr. J. A. Jacobs.

Sinking is being carried on in the shaft of the Columbia Cobalt, which is under lease. The vein left the shaft at a depth of 30 feet, but the work will be carried on to the 75-foot level, where a cross cut will be run to tap the vein. If the values show up as well at the 75-foot level as at the 30-foot, a plant will be installed.

The North Cobalt Mine is under lease. A shaft will be sunk to a depth of 75 feet and then a cross-cut run, to cut the vein.

On the properties of the Holden Silver Mining Co., operating in Tudhope Township, the shaft is down over 90 feet and the company is carrying on the development work in a progressive manner.

The Empire Mining Co., which owns a number of claims in both Coleman and Lorraine, is doing active development work on their property in the latter township. A force of men are engaged in sinking the shaft which at the present time is down over 50 feet. The company expects to carry the shaft to a depth of 125 feet before any drifting is done. Several stringers of calcite are showing in the shaft. Good camps have been

erected and the equipment consists of one 35-h.p. boiler, a hoist and drill. It is probable that in the near future a compressor will be installed.

The new plant being installed by the Otisse Mine, Silver Lake, is expected to be in operation early in March. It consists of two 80 h.p. boilers, a nine-drill compressor, six drills, hoists and pumps. The total cost, including buildings, will be in the neighborhood of \$20,000. Two shafts are being sunk at a distance of 600 feet apart, and these will be connected by a cross cut, which is expected to cut a number of veins discovered on the surface. Cross cutting from the shafts will be commenced at a depth of 100 feet.

A force of thirty men are doing development work on the Hayden property. The shaft is now down over 70 feet and the vein varies in width up to 24 inches and carries silver values.

The W. J. Clerihue Syndicate, which owns eleven claims in South Lorraine, has recently ordered a plant which it is expected will be in operation about the first of April. It consists of a hoist and boiler sufficient to run two or three drills. A force of ten men are employed.

At the Davis fraction at Giroux Lake the shaft is down to a depth of 85 feet and is now being timbered. Three calcite veins are found in the shaft, two being one inch in width and the other 6 inches.

A curious accident occurred recently in the Columbus Mine, when drilling on the 250-foot No. 3 level. The men were drilling to cut No. 1 vein, when a subterranean body of water was encountered, which rushed with great force into the workings. The mine was promptly abandoned, and in an incredibly short time the water had drowned out the pump and risen to second level, where it was held in check by two station pumps. The next day the force of water grew less and it was soon under control. A few days after the men started to work again, but when the first round was taken out the water came in again with greater force than before, and everything had to be taken out of the mine. For the present all work has been stopped.

A strike of great importance was made recently at the Big Pete Mine of the Cobalt Central. A new silver vein was cut by the diamond drill 170 feet from the present workings of the third level of the mine, and at a depth of 410 feet from the surface. This is, with one exception, the greatest depth at which values have been found in this camp.

Fifty men are at present employed at the Chambers Ferland, and the work is being carried on in a very progressive manner.

The Red Jacket Mining Co. in Coleman, whose holdings were formerly known as the Morrisou property, are installing a plant consisting of a 100 h.p. boiler, an 8x10 hoist, a 6-drill compressor and three drills.

A cross cut is being run from the 175-foot level of the Rochester and the management expect to cut the vein shortly. The vein left the shaft at the 85-foot level, but no cross-cutting was done until the 175-foot level was reached.

Excellent progress is being made on the property of the Alexandria Mining Co. which adjoins the Bailey on the west. The main shaft is being sunk and is now down to a depth of 175 feet. Sinking will be continued to the 250-foot level, and from that depth diamond drill holes will be bored to test the surrounding country.

The new strike on the Silver Leaf is supposed to be a continuation of the main vein, which was worked last fall. The vein was cut off by a fault, and to the present the continuation had not been discovered.

A contract has been let to sink a shaft on the Farah property, adjoining the Nova Scotia.

The plant of the Colonial mine is being moved to the property of the Temagami Cobalt Silver Mining Co., under the

supervision of Mr. Somers, mechanical engineer for this company.

It is said that Cobalt is to have a custom sampler, the plans of which are now being prepared. The work of installation will commence in the near future. The sampler will fill a long-felt want, as a lack of proper sampling facilities has proved to be a serious handicap in handling the class of ores which are encountered in this camp.

The new shaft of the Ontario Development & Mining Co., in the first concession of Coleman, is down fifty feet.

It is expected that the new plant being installed by the Kerr Lake Majestic will be in operation shortly.

A small surface plant is to be installed by the Quaker City Mining Co., close by the Temiskaming. A force of 20 men are at work on the property.

The Hydraulic Co. have purchased more drills, and are carrying on their operations in a progressive manner. They expect to be able to supply air and electricity by next July.

On February 25th the Kerr Lake discovered a new vein 10 inches wide, carrying 6,000 oz. of silver. The negotiations between the Kerr Lake and the Hargraves for the use of one of the shafts of the former company to develop the Hargraves property, are still pending.

A rich vein of ore one inch wide was discovered in No. 2 cross-cut of the Crown Reserve, which runs almost parallel to the cross-cut. Returns of ore shipped in the month of January show a value of \$175,000. One hundred and thirty men are working at the mine.

A new strike, 3 feet wide, and carrying good values, was made on March 2nd at the Chambers-Ferland. The car of high-grade ore now at the Denver smelter shows exceptionally high values.

G. C. Brewer, of Cobalt, has secured the contract for transporting the Bartlett mining machinery to Gowganda. There will be 25 teams at work on the job. The contract price is \$12,000.

The Town of Cobalt has decided to appeal against the decision of the High Court in regard to the litigation of the Coniagas mine.

## BRITISH COLUMBIA.

**Roseland.**—Mining is a little quiet in this district at the present time, as the full working force has not yet been put back into the Le Roi since the recent shut-down. During the week ending February 20th the Le Roi shipped 1,295 tons of ore, the Centre Star group 3,580, and the Le Roi 2, Ltd., 455 tons. Work at the smaller mines and leases is not as active as it may be a little later on in the season, as at the present time there is a lot of water to contend with in many of these smaller properties, and adequate pumping facilities are not always on the ground.

A few weeks ago the Mugwump Mining Co. breathed its last, the affairs of the company having been wound up by A. B. Mackenzie, liquidator. One stockholder who owned 100 shares that he bought thirteen years ago, expecting to make a handsome profit on his investment, received 15 cents for his holdings. The Mugwump claim, which it is expected will some day prove to be a valuable property, was bought in by the Consolidated Co. for \$2,000; of this sum \$520.63 was eaten up with the legal expenses, leaving \$493.83 to divide among the stockholders.

**Nelson.**—The Star Mining & Milling Co., of Sandon, in its action against the Byron N. White Co., has again been awarded the decision, in this case by the Supreme Court of Canada. This case, which lately involved a question of apex rights, of much importance to Slocan miners, was begun in 1901 for trespass by

the taking of ore, for an injunction and damages. While no definite action has yet been taken by the White Company in the matter, it is probable that the case will be taken before the Privy Council, as both sides are most positive that they are in the right, and feel as though the case should be fought to a finish.

One of the successful Cobalt mining men, Mr. Jas. McMartin, president of the La Rose Consolidated Mining Co., has been interested by J. L. Warner in the Mother Lode group on Sheep Creek, the Kootenay Belle also being included in the deal. Extensive development work will be done on the property acquired and the mines placed on a heavy producing basis. The Kootenay Belle adjoins the Queen mine, which to date has paid nearly half a million dollars to its operators.

A bond has been taken on the Yukon claim in the Ymir district by H. L. Rodgers, of Spokane, who some time ago acquired the American Girl and Canadian Girl claims. The price at which the Yukon has been acquired is said to be \$35,000, 10 per cent. of which was paid upon the signing of the papers.

The Central Mining Co., and the Scranton Coal Mining Co., operating near Lethbridge, have been consolidated, and will work on a larger scale in the future. The property is at present producing about 500 tons of coal per day, but this output is to be increased to 800 to 1,000 tons per day in the immediate future.

The ore body recently opened up on the Independence group, Sheep Creek, has widened to about 20 inches, and is looking much better as the work proceeds. This ore ought to run about \$185 per ton, judging from what has been shipped heretofore.

An 8-foot ledge was cut on the Queen during the past week that will give an average of \$43 per ton. This property continues to mill its weekly quota of 420 tons of second-class ore, and makes shipments of the higher class of ore at regular intervals.

The Le Roi 2, Ltd., Rossland, has declared a dividend of two hillings per share. It is understood that this is to be taken in the nature of a quarterly dividend, and that others will be forthcoming at the proper time. The Le Roi 2 certainly makes good showing for a property working on such a small scale in low-grade ore, comparatively speaking, of course.

At the Second Relief, Erie, the company milled 145 tons of ore during the past week. Shipments are being made to Northport smelter, and the mine is looking fairly well.

The big stamp mill at the Blue Bell continues to work steadily and treat its 900 tons of lead-zinc ore per week. The company has crushed 5,900 tons of ore so far this year, and has sent out nearly 600 tons of crude ore besides.

The Molly Hughes, Yankee Girl, Silver Hustler, Silver Glance and other light shippers of the district have already appeared on the shipping list.

At the Aurora, on Moyie Lake, the operators are meeting with much success. The ore is coming in at several levels, and there is a quantity of good shipping ore on hand that will be sent out at an early date.

Milling at the Whitewater is going on steadily at the rate of about 700 tons per week. The company has treated nearly 5,000 tons of ore so far this year.

**Phoenix.**—During the week ending Feb. 27th, the shipments from Boundary amounted to 31,544 tons, the Granby shipping 21,397, Mother Lode 7,800, Oro Denoro 155, and Snowshoe 2,170 tons.

The formation of the Osoyoos Mining Co., to take over and work 1,920 acres of coal lands in the Similkameen valley, is announced. Those interested recently bored a test hole over 800 ft., cutting over 50 feet of coal. The coal found in this locality is a good quality of bituminous fuel.

The Sacramento claim, near Hedley, is about to be worked again. Development will be pushed for some time.

The report of the British Columbia Copper Co. for the fiscal year ending Nov. 30, 1908, shows that the company mined, refined and sold its copper during the last seven months of operation at a cost of 9.996 cents. The cost per ton of ore handled was \$2.6322. The total earnings of the company during the fiscal year were \$1,086,635; ores sold, etc., \$13,324, making a total of \$1,099,959. From this was written \$899,475 for expenses, maintenance, etc., and \$106,793 for decrease in the market value of metal unsettled for Nov. 30, 1907, and expenditure during the suspension of operations from Dec. 1, '07, to April 30, '08, leaving a net profit for the year of \$93,691. The surplus shown at this time is \$269,732. The showing is good, and it is gratifying to see that by the co-operation of the different departments of the company the price of producing its copper was kept down to the low figure of 9.996 cents, which augurs well for the future.

**Vancouver.**—The Government has introduced a bill making several minor amendments to the Mineral Act. Section 8 is being changed, elucidating the point of mining without a miner's license. The question of the share of a partner or co-owner who has allowed his free miner's license to lapse will also be simplified. Section 36, regarding the securing of a certificate of improvement prior to the issuing of a Crown grant, will be amended to provide that prior to obtaining a Crown grant a certificate of improvement will be obtained from the Gold Commissioner, and prior to that a certificate of work from the mining recorder. The life of a certificate of work in future will be but three months, if this bill is passed, when the provision will come into force April 1, 1910. A further minor change will be the charging of a fee of \$10, instead of \$5, for the issuing of a Crown grant to surface rights of mineral claims.

The property of the Mountain Boy group on American Creek at the head of Portland Canal has been bonded by T. Hopkins, of Seattle, who has a number of American capitalists behind him. The group of four claims has been taken over at a figure in the neighborhood of \$125,000. Mr. Hopkins has also secured control of the charter of the Portland Canal Mining Co., which embodies valuable railway privileges, and it is the intention to build a railway under this charter from the town of Stewart to the mines on American Creek.

## GENERAL MINING NEWS.

### ONTARIO.

**Kingston.**—The annual meeting of the Eastern Ontario section of the C. M. I. was held in the School of Mining, Kingston, Thursday, Feb. 25th, the president, Prof. J. C. Gwillim, in the chair.

The election of officers for the ensuing year resulted as follows: President, Prof. J. C. Gwillim; Vice-President, Prof. M.

B. Baker; Secretary-Treasurer, John Donnelly, M.E.; Assistant Secretary-Treasurer, E. H. Birkett.

The following papers were read and discussed: "The Wilbur Iron Ore Deposit," by S. King; "Diamond Drill Methods as Practised in the Michigan Iron Ore Range," by J. K. Osborne; "Summer Experiences of an Undergraduate," by F. Ransome. Two other papers, entitled "The Diabase and

Aplite of the Cobalt Silver District," by N. L. Bowen, and "The Chromiferous Peridotites of Lake Abitibi District," by H. T. White, were to be read, but owing to the lateness of the hour it was decided to leave this over till next meeting.

A vote of thanks, on motion of Dr. Goodwin, seconded by Mr. Donnelly, was tendered to the students presenting the papers, and the meeting adjourned.

The Queen's branch of the C. M. I. is to be congratulated on its increased membership, having increased in the last year from 47 to 87. It is expected that a large number of the local branch will attend the annual meeting of the Institute, which is to be held in Montreal.

**Cobalt.**—One hundred and eight veins have been found on Nipissing. Three hundred and ten men are employed, and there are 20,000 feet of underground development work.

A three-inch vein in wall rock has been found at the 100-foot level in the Silver Leaf.

While cross-cutting at the 250-foot No. 3 level at the Columbus mine the men drilled into No. 1 vein and struck a submarine lake. Within a few hours the water reached No. 2 level at 150 feet. The company put four pumps at work, but they could not cope with the water, and the mine is for the present idle.

A miner named Boyes, an employee of the Nipissing mine, was sentenced in Cobalt Police Court to eighteen months in the Central Prison for high-grading.

Two hundred and fifty men and 18 drills are working at La Rose, and 250 men and 17 drills at Nipissing.

The Fourth of July shaft at the Nipissing is now down 165 feet. During February \$75,000 worth of ore was taken from shaft-sinking alone. In one day 564 sacks of ore were brought up.

The timbering of the Badger main shaft is almost completed. Rich ore is being taken out at the 100-foot level, calcite and native silver. The main shaft is now down 225 feet. Seventy-five men are at present employed.

Three new veins have been discovered at the 100 and 150 foot levels of Kerr Lake mine, with a total width of 35 inches.

The action of William Armstrong, in which he claimed one-sixth interest in the Lawson mine, has been dismissed.

Thirteen veins have been found on the territory of the Cobalt Station Grounds Mining Co. Four veins are to be cross-cut on the McKinley-Darragh side. Towards the north, near the Right of Way several veins are expected to be cross-cut.

**Gowganda.**—Trouble is feared over the location of the Gowganda townsite. At first the Government located the townsite in a place at Gowganda Lake where prospectors claim three feet of water will be found in the slough in the spring. The new townsite, as proposed, will be on better grounds, but many who claim to be in possession of the facts say the Government is trying some scheme which makes those interested feel that they will have to abandon their rights to make room for the new townsite.

It is most regrettable that with so much money waiting to be spent in Gowganda, as well as the enormous sums already spent, the matter of a townsite could not have been permanently settled some time ago.

**Elk Lake.**—A new ore-chute has been opened up at the Mother Lode mine, showing a vein of high-grade ore about 12 inches wide.

Three drills are being operated at the Otisse-Currie, and the shaft is down to the 60-foot level, from which level drifting has been commenced. The following buildings have been erected: Powerhouse, 30x40 ft.; office, cookhouse, sleeping camp, pump-house and stable. Forty men are at present employed.

**Fort William.**—A strike of gold ore has been made near Sturgeon Lake on the Grand Trunk Pacific. A stampede is expected as soon as the weather moderates.

## ALBERTA.

**Edmonton.**—M. J. O'Brien, of Renfrew, Ont., has formed the Yellowhead Pass Coal & Coke Co., Ltd., which will commence this summer the development of a hard bituminous coal field west of Edmonton. The coal property embraces an area of 5,120 acres. It is situated 24 miles southwest of the G. T. P. where it crosses the Macleod River. The coal has the same appearance as the bituminous coal of the Crow's Nest Pass. The preliminary work of uncovering the coal seams will be begun in August, but actual mining will probably not take place before the summer of 1910.

**Pincher.**—There are five veins averaging eight feet in width on the property of the Pincher Creek Coal Co. The holdings consist of 1,200 acres. The miners are down 150 feet, three shifts sinking an incline shaft. Between 300 and 400 tons of coal will be shipped daily before the end of next summer.

**Lethbridge.**—The South Alberta Irrigation Co. struck a flow of seven million cubic feet of natural gas per day at Bow Island at a depth of less than two thousand feet.

## BRITISH COLUMBIA.

**Fernie.**—The Crow's Nest Pass Coal Co. intend doing a large amount of building in the near future. It is intended to build 1,000 more coke ovens, and other improvements are to be made.

At Michel the Crow's Nest Pass Coal Co. are daily producing 1,800 tons of coal and 750 tons of coke.

**Hosmer.**—The new collieries of the C. P. R. began the shipment of coal and coke on December 19th, 1908. Two hundred and forty beehive coke ovens, with a daily capacity of 300 tons, are in use.

**Rossland.**—The Republic mine, sold some time ago for taxes, is to be reopened. The new Republic Company will take over the property and franchises of the Republic Light and Water Company. The facilities will be improved and the surplus power used in driving the machinery, which is now en route from the East.

Active mining will start in the winze as soon as the hoisting plant is installed. To exhaust the ore now in sight will take at least two years of steady operation. One car of ore has already been sent to the smelter.

Preparations are being made to increase the output of the Granby smelter. The furnaces are being enlarged from 18 to 22 feet in length, and the capacity of the converter plant for producing blister copper has been increased to 36,000,000 pounds per annum.

**Moyie.**—Three feet of crude ore has been struck in No. 3 raise off the main tunnel in the Aurora mine. An 18-inch vein has also been found in the main tunnel, which has now been driven a distance of 450 feet.

**Nelson.**—The Blue Bell is shipping at the rate of nearly 700 tons a month, and receiving substantial bounty benefit.

The Canadian Zinc Co. are reorganizing on a larger capital basis to give the company a larger scope for operations and the purchase of ores.

The 8-inch paystreak of the Independence mine at Shee Creek in the west drift of the new lower level has widened to twenty inches.

An 8-foot streak was found on the Queen mine, showing a average assay of \$43 gold per ton.

Three of the five lower levels of the Silver King have been unwatered. Four machine drills are now in operation, and 26 men are employed.

The Consolidated Mining & Smelting Co., of Trail, have taken a two and a half year bond on the Queen Victoria mine. The mine is equipped with the most modern machinery, and shipments of ore to the Trail smelter will begin immediately.

**Ymir.**—H. L. Rodgers, of Spokane, who recently took bonds on the Canadian Girl and American Girl mines, has secured possession of the Yukon property. The Yukon adjoins the American Girl, and the intention is to combine the two properties. The price paid was \$35,000.

**Vancouver.**—The Nuba and Early Bird Mining Companies will jointly install a 20-stamp mill on their claims at Gold Harbor on the west coast of Moresby Island, Queen Charlotte Islands. The order for the plant has been placed in Germany.

The Nuba Company owns fifty-four claims near Gold Harbor. Twenty men have been engaged at development work since last autumn.

At Rose Spit, Queen Charlotte Island, preparations are under way for prospecting and working the black sand in that vicinity.

**Victoria.**—The Government has introduced a bill for the amendment of the Mineral Act. Section 8 is amended by making clearer the penalty for mining without a miner's license.

Another change is simplification of the proof required to vest in man the share of a partner or co-owner who has allowed his free miner's license to lapse.

Section 36, regarding the obtaining of a certificate of improvements prior to the issuance of a Crown grant, is amended to provide that prior to obtaining a Crown grant a certificate of improvement or improvements has to be obtained from the Gold Commissioner, and prior to that again a certificate of work from the Mining Recorder. In future the life of the certificate of work will be but three months. This provision is not to come into force until April 1st, 1910.

Another minor change is the charging of a fee of \$10, instead of \$5, for the issuance of a Crown grant of the surface rights of a mineral claim.

## MINING NEWS OF THE WORLD.

### GREAT BRITAIN.

The coal owners have applied to the Coal Conciliation Board for the federated mining districts in England and North Wales for a 5 per cent. reduction in the existing rate of wages. The Board could come to no agreement on the subject, so the matter was referred to Lord James of Hereford, the independent chairman, for his casting vote.

The Board of Trade returns for the month ending January 31st, 1909, are: Tin—Imports 3,564 tons, value £465,702; exports, 993 tons, value £129,975. Copper—Imports, metal, 8,180 tons (£502,894); ores, 7,727 tons (£75,150); exports, 2,870 tons (£196,673). Lead—Imports, 18,613 tons (£246,694); exports, 2,765 tons (£45,084).

### GERMANY.

An amalgamation of German zinc works, with the co-operation of a large number of Belgian, French, Dutch and Austrian zinc firms, has been completed in Berlin, under the title of the Zinc Smelters' Association, Limited, with a capital of 2,047,000 marks. The basis for an international agreement with other European spelter firms has already been arranged.

### RUSSIA.

The latest figures available concerning asbestos production show that there were 25 mines in operation, employing 1,900 men, and the output amounted to 15,970,285 lbs. The mines are in the Ural Mountains, in the Province of Perm, also in the Altai Mountains of Siberia.

### INDIA.

With a view to encouraging the study of mining, the Government of Bengal, East Bengal and Assam intend to give scholarships to students, who will study the subject in the Shibpur Engineering College.

### AUSTRALASIA.

The tin mines of Tasmania employed during the last quarter of 1908 a total of 1,747 men, 1,461 of whom were Europeans and the balance Chinese.

The gold productions of the various states for January are as follows: Queensland, 24,500 oz., or \$506,415; Victoria, 40,848 oz., or \$844,328; Western Australia, 132,267 oz., or \$2,713,959; New South Wales, 19,885 oz., or \$411,023.

The mineral production of New South Wales for the year 1908 is valued at £8,609,607, including £954,854 for gold, £2,947,824 for lead and silver, £502,812 for copper, £205,447 for tin, £3,353,093 for coal. The coal production was 9,147,028 tons.

### SOUTH AFRICA.

The Natal Government has appointed a commission to revise the mining laws of the colony; to advise as to the best means of encouraging and assisting the development of the mineral resources of the colony, especially in regard to gold and base metals, and to advise as to the necessity for reorganizing the Mines Department.

The output of Cassiterite in the Transvaal for 1908 was 1,427 tons, of a total value of £97,188. Practically the whole of this has been mined from the Waterbury district.

The scheme for supplying the Rand mines with electric power provides for many of the mines using this power by the beginning of next year. In order to do this it will be necessary to convert their present steam plants to electric working installations.

### WEST AFRICA.

The West African Chamber of Mines states that the gold yield of the colony for January was 22,817 oz., valued at £91,112, a decrease of 1,807 oz., or £7,150 compared with the preceding month.

### UNITED STATES.

Goldfield, Nevada, has been selected as the place for the next annual convention of the American Mining Congress.

According to the Bureau of Statistics, in the Department of Commerce and Labor, the value of copper and manufactures of copper exported during December was \$6,958,710, which compares with \$11,337,544 in corresponding month of year previous. The total copper exported during 1908 amounted to \$90,555,503, as compared to \$100,800,355 in 1907.

The Calumet and Hecla's regrinding plant is showing excellent results in the saving of copper heretofore lost in the tailings. With the plant in full operation a saving of 3,000,000 lbs. of copper annually will be made at a cost of about 12 cents per lb.

It is expected that the placer gold output of Oregon for 1908-9 will be the greatest in years. Every mine is in full operation, and the rains have been heavy and unbroken.

#### MEXICO.

Owing to the unsatisfactory conditions in the metal markets, which have resulted in the shutting down or the short time

working of many Mexican mines, the smelters of the American Smelting and Refining Company are working on half time. The scarcity of silicious ores in Mexico is being felt by metal reduction works.

There has been an increased demand for zinc ores since the recent decision of the U. S. Court of Appeals making carbonate ores and calomine free of duty in their importation into the United States.

Oil will soon replace coal as fuel in all the mine power-houses of the Cananea Copper Co., the misunderstanding with the Federal Government as to the scope of the concession having been adjusted about a month ago.

## COMPANY NOTES.

At the annual meeting of the Dominion Coal Company, called for March 4th, an adjournment will be made to a later date for the transaction of the business of the meeting. The directors of the Dominion Coal Company, Limited, have made an offer to the Dominion Iron and Steel Company, Limited, covering the settlement of pending litigation. It is deemed advisable to await the reply of the Dominion Iron and Steel Company, Limited, before proceeding with the business of the annual meeting of the Dominion Coal Company, Limited, in order that a complete and more definite statement than is now available may be presented to the shareholders.

#### "SCOTIA" PFD. DIVIDEND.

Nova Scotia Steel directors have declared the quarterly dividend of 2 per cent. on the preferred stock, payable April 15.

#### INTERCOLONIAL COAL ANNUAL.

The annual meeting of the shareholders of the Intercolonial Coal Mining Company, Limited, took place in Montreal, March 3rd. The output of coal and coke for the year amounted to 310,198 tons.

The following were elected directors: Messrs. James P. Cleghorn, W. M. Ramsay, R. MacD. Paterson, K. W. Blackwell, E. Goff Penny, D. Forbes Angus and Duncan Robertson.

At a subsequent meeting of the Board the old officers were re-elected.

Mr. Duncan Robertson is an addition to the Board since last year.

#### ANOTHER DIVIDEND.

The Temiskaming & Hudson Bay Co. has declared another \$3 dividend, or at the rate of 300 per cent., making total dividends since its inception 12,400 per cent.

#### POSITION OF LA ROSE.

From June 1st to December 31st, 1908, La Rose produced 1,764,146 ounces silver, and made net profits of \$650,566. It has paid two dividends, one of 3 per cent., on October 20th, 1908, and one of 3 per cent., with a bonus of 1 per cent., on January 20th, 1909.

It will be seen that in seven months' operations La Rose has very nearly earned its entire dividend requirements for one year on a 12 per cent. basis.

Its present known ore reserves—by far the largest in Cobalt—are sufficient for dividend requirements on this basis for five years to come.

Cobalt has produced since its discovery 48,678 tons of ore. The La Rose mine has shipped 9,483 tons of ore, or nearly 20 per cent. of the total production of the camp.

January net earnings of the La Rose Company amounted to \$90,000. Net earnings for the eight months ended January 31 amounted to \$739,584, out of which two regular and one extra dividend was declared, calling for the total payment of \$420,000, leaving surplus earnings of \$319,584.

#### COBALT LAKE MEETING.

The annual meeting of the Cobalt Lake Mining Co. was held at Ottawa, February 27th.

The consulting engineer, Mr. E. L. Fralick, said no very hopeful outlook as to prospects could be held out; but there was a possibility of soon striking the McKinley-Darragh vein, toward which they have been working for some time.

The financial statement for the year showed the working expenses to have been \$142,554.56, while the proceeds were \$83,547.14, which included interest, transfer fees, ore sales and ore on hand, leaving a balance at debit of profit and loss of \$59,007.42. Adding the balance from 1907, \$132,776.20, to this, the balance at debit of the profit and loss account December 31st, 1908, amounts to \$191,783.62.

The consulting engineer, Mr. E. L. Fralick, reported that 3,272 feet of work had been done during the year, comprising 3,138 feet of drifting and cross-cutting and 134 feet of sinking. In addition, 18,000 cubic feet of stoping had been done. According to Mr. Fralick, the past year has seen the end of the dead work, and every one of the machines is driving in conglomerate or Huronian slate.

The report of Mr. D. B. Rochester, managing director, contains some interesting information. The mine has been operated without interruption, except for a few days, with an average of 60 men. Most of the underground work done has not met with much success, so far as discovering silver is concerned. This is probably owing to the formation existing on the east side of the lake from the centre to the south end, where most of the work has been done. It is hoped that the McKinley-Darragh and Right of Way veins will be encountered shortly. Owing to the property being under water this is probably the most expensive property to work in the camp.

Mr. D. B. Rochester, the managing director, was formerly paid \$4,000 per year, but owing to the amount of criticism he resigned and a new arrangement was made whereby Mr. Rochester was to be paid \$200 per month. Mr. Rochester was to give all the time necessary to Cobalt Lake Mining Co., but was to have permission to engage in other business in his spare time.

The old Board of Directors was re-elected as follows. President, Sir Henry M. Pellatt; Vice-President, Geo. F. Henderson, K.C.; Directors, M. Marehand, John H. Avory, Major J. A. Murray, Thos. Birkett, Gordon C. Edwards, Dr. C. Cousens and D. B. Rochester.

Letters patent have been granted to the Crown Exploration and Development Company, Limited, Montreal, with capital stock of one million dollars. The provisional directors are mostly leading figures in the Crown Reserve Mining Company, namely, Robert Reford, John Carson, W. I. Gear, Peers Davidson and James Cooper.

RIGHT OF WAY ANNUAL MEETING.

At the annual meeting of the Right of Way Mining Co., Limited, it was decided to pay a quarterly dividend of 6 per cent., together with a bonus of 9 per cent., payable on April 1. Books close on March 22 and reopen April 1.

NANCY HELEN ANNUAL MEETING.

The directors and stockholders of the Nancy Helen met at the mine office. W. R. Smyth, M.P., was elected President;

Shirley Ogilvie, of the Ogilvie Milling Co., was elected Vice-President; J. A. Hutton, merchant, Thornton, Ont., a director, and William Black, Secretary-Treasurer. The directors were empowered to lease or deal with the 40-acre lot in Bucke Township belonging to the company in any way advantageous to the company.

TEMISKAMING DIVIDEND.

The directors of the Temiskaming Mining Company have declared the regular quarterly dividend, which will be paid on April 1. It finally disposes of the rumors to the effect that this company would pass its dividend this quarter.

A quarterly dividend of two shillings per share has been declared by the Le Roi No. 2 Mining Company, payable on March 11th.

STATISTICS AND RETURNS.

NOVA SCOTIA STEEL OUTPUT.

The coal output of the Nova Scotia Steel Company amounted to 55,667 tons for February. The company has about fifty thousand tons on the bank, which will be increased. The pig iron output was 5,000 tons, and the product of the steel plant slightly above that figure. All departments are in satisfactory operation.

CUMBERLAND COLLIERIES.

The shipments from the collieries of the Cumberland Railway and Coal Company for the month of February were 27,191 tons.

STEEL COMPANY OUTPUT.

Dominion Iron & Steel Company's output for February is as follows: Pig iron, 20,200 tons; steel, 22,500 tons. Total shipments, about 20,000 tons.

DOMINION COAL OUTPUT.

The output of the Dominion Coal Company's collieries last month was 207,328 tons. The shipments were 119,646 tons. The output in January was 195,971 tons. In February of last year the output was 282,508 tons, and for February, 1907, the figures were 226,490 tons.

Considering that February was a short month, the output shows a satisfactory improvement over January. The February output in detail was as follows:—

|                   |         |
|-------------------|---------|
| No. 1, Dominion   | 40,298  |
| No. 2, Phalen     | 40,127  |
| No. 3             | 12,924  |
| No. 4, Caledonia  | 29,210  |
| No. 5, Reserve    | 40,527  |
| No. 6, Donkin     | 1,250   |
| No. 7, Hub        | 9,065   |
| No. 8, Bridgeport | 13,428  |
| No. 9, Bridgeport | 20,359  |
| Total             | 207,328 |

CROW'S NEST PASS OUTPUT.

The output of the Crow's Nest Pass Company's collieries for the week ending February 26th was 15,785 tons, a daily average of 2,631 tons. The output of the Crow's Nest Pass Company's collieries for the week ending March 5th was 14,940 tons, a daily average of 2,190 tons.

COBALT ORE SHIPMENTS.

# Amatite ROOFING

Hume Saw Mill, Fairfield, Me.

### Why Use Paint to Protect Your Roof?

WHY not get a roofing in the beginning that will protect itself—that needs no painting?

All smooth surfaced ready roofings require a coat of paint or some liquid every year or so. The roofing itself merely acts as a base for the paint. If you fail to put it on, your roof doesn't last very long.

Amatite Roofing requires no paint of any kind. It gives protection from the moment you lay it on until it is worn out, without spending another cent for extras.

Its *real mineral surface* makes this possible.

What you spend merely for paint and repairs on other roofs will in a few years pay entirely for an Amatite roof.

For Farm Buildings it is specially satisfactory and economical.

Anyone can lay Amatite. It requires no skilled labor. Nails and liquid cement for laps are furnished free with each roll.

Write for **Free Sample** and Booklet and investigate its merits for yourself.

**PATERSON MFG. CO., Limited**

## A NEW AND IMPORTANT PUBLICATION

Of interest to all Coal Mine Operators and Mining Men generally.

# The Dominion Coal Company

An Historical and Descriptive Pamphlet of 128 pages

Fully illustrated with half-tone diagrams and maps

The descriptions of the mining methods, fire-fighting and life-saving organizations, labor conditions, transportation facilities, etc., etc., of the Dominion Coal Company's huge enterprise are well worthy the attention of both technical workers and investors.

Mr. F. W. Gray, the author of this brochure, has done his work most capably.

The book has just appeared from the press.

**Its price is \$1 net.**

# A Handy Reference List

We urge you to examine the books listed below with great care. Some are brand new—all are standard. We can supply any technical book in print

## Copper

### Principles of Copper Smelting

BY EDWARD D. PETERS,

*Professor of Metallurgy, Harvard University.*  
612 pages, 6x9; cloth. \$5.00 (21s.) postpaid.

### Modern Copper Smelting

BY EDWARD D. PETERS.

640 pages, 6x9; cloth, \$5.00 (21s.) postpaid.

### Copper Mines of the World

BY WALTER HARVEY WEED.

376 pages, 6x9; cloth, \$4.00 (17s.) postpaid.

### Notes on Lead and Copper Smelting and Copper Converting

BY HIRAM W. HIXON.

128 pages, 6x9. \$3.00 (12 6) postpaid.

### Pyrite Smelting

BY T. A. RICKARD,

*Formerly Editor of THE ENGINEERING AND MINING JOURNAL.*  
210 pages, 6x9. \$2.00 (8 6) postpaid.

### Matte Smelting

BY HERBERT LANG.

98 pages, 6x9. \$2.00 (8 6) postpaid.

## Lead and Zinc

### The Metallurgy of Lead

BY H. O. HOFMAN

*Professor of Metallurgy, Massachusetts Institute of Technology.*  
600 pages, 6x9. \$6.00 (26s.) postpaid.

**BOOKS BY WALTER RENTON INGALLS,**  
*Editor of THE ENGINEERING AND MINING JOURNAL.*

### Lead and Zinc in the United States

6x9; cloth. \$4.00 (17s.) postpaid.  
(Price subject to change)

### The Metallurgy of Zinc and Cadmium

701 pages, 6x9; cloth. \$6.00 (25s.) postpaid.

### Lead Smelting and Refining

336 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

### Production and Properties of Zinc

328 pages, 6x9; cloth. \$3.00 (12 6) postpaid.

## Gold and Silver

### The Chemistry of Cyanide Solutions

Resulting From the Treatment of Ores.

BY J. C. CLENELL

164 pages, 6x9 cloth, illustrated, \$2.50 (10 6) postpaid.

### Practical Notes on the Cyanide Process

BY FRANCIS L. BOSQUI, PH. B.

*Superintendent of the Standard Consolidated Mining Company's Cyanide Works, Bodie, Cal.*

201 pages, 5½x9, illustrated, \$2.50 (10 6) postpaid.

### Stamp Milling of Gold Ores

BY T. A. RICKARD.

6x9; illustrated. \$2.50 (10 6) postpaid.

### Hydrometallurgy of Silver

BY OTTOKAR HOFMANN.

336 pages, 6x9; cloth. \$4.00 (17s.) postpaid.

## Iron and Steel

### The Manufacture and Properties of Iron and Steel

BY HARRY HUSE CAMPBELL,

*Metallurgical Engineer for the Pennsylvania Steel Company, etc.*

Entirely revised in 1907. 641 pages: 6x9; illustrated.  
\$5.00 (21s.) postpaid.

### The Metallurgy of Iron and Steel

BY BRADLEY STOUGHTON,

*Adjunct Professor of Metallurgy, School of Mines, Columbia University.*

Fully illustrated; 6x9. \$3.00 (12 6) postpaid.

### The Metallurgy of Steel

BY HENRY M. HOWE, A.M., S.B., L.L.D.

9x12; fully illustrated. \$10 (42s.) postpaid.

## The Manual of Fire Assaying.

BY CHAS. H. FULTON

176 pages, 6x9, illustrated. \$2.00 (8 6) postpaid.

Immediately upon its publication the leading assayers, metallurgists and professors of the country hailed this as the best work yet issued on the subject. It substitutes exact knowledge for the rule-of-thumb.

## Ore Dressing

BY ROBERT H. RICHARDS,

*Professor of Mining, Massachusetts Institute of Technology.*

Two volumes. 6x9; cloth, 1250 pages. Profusely illustrated. Per set, \$10.00 (42s.) postpaid.

The standard authority on all classes of ore dressing by one of the leading mining authorities of the world.

Toronto.

SOLE AGENTS FOR CANADA.

# PROFESSIONAL DIRECTORY.

The very best advice that the publishers of the Canadian Mining Journal can give to intending purchasers of mining stock is to consult a responsible Mining Engineer BEFORE accepting the prospectus of the mining company that is offered them. We would also strongly advise those who possess properties that show signs of minerals not to hesitate to send samples and to consult a chemist or assayer. Those who have claims and who require the services of a lawyer, with a thorough knowledge of Mining Law, should be very careful with whom they place their business.

## JUDICIAL SALE

of assets of The Wet Process Reduction Company, Limited.

Tenders will be received addressed to the Master in-Ordinary, Osgoode Hall, Toronto, and marked "Tender, Re The Wet Process Reduction Company, Limited," up to four o'clock p. m. of the 25th day of March next for the purchase of the assets of the above named Company. Such tenders shall be for the following parcels en bloc:

|           |                                                                                                                                                                               |           |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| Parcel 1. | Plant, Machinery and Tools.....                                                                                                                                               | \$5667.50 |
| " 2.      | Supplies and raw material.....                                                                                                                                                | 1248.47   |
| " 3.      | Dominion of Canada Patent Number 91314 issued to George E. Kingsley and covering apparatus for the treatment of sulphides and other ores together with formulæ for treatment. |           |

The stock sheet and detailed schedule of assets can be examined at the office of E. R. C. Clarkson, Esquire, the liquidator, and the stock-in-trade, machinery, fixtures, etc., may be inspected upon application to him.

Terms of sale:—25 per cent in cash and the balance in two and four weeks, secured to the satisfaction of the liquidator.

A marked cheque payable to the liquidator for 10 per cent of the amount of the tender must accompany each tender which will be returned if the tender is not accepted.

The tenders will be opened by the Master-in-Ordinary at his Chambers, Osgoode Hall, Toronto, on the 26th day of March next at the hour of 11 o'clock a.m. and all who tender are requested to be then present.

The highest or any tender not necessarily accepted.

The other conditions of sale are the standing conditions of the Court so far as applicable.

For further particulars apply to the liquidator or his solicitors.

Dated at Toronto this fourth day of March, 1909.

E. R. C. CLARKSON, Liquidator,  
33 Scott Street, Toronto.

DELAMERE, REESOR & ROSS, Solicitors for Liquidator  
18 Toronto Street, Toronto.

# Geological Survey

## **PUBLICATIONS**

The Geological Survey has published maps and reports dealing with a large part of Canada and with many local areas and special subjects

### **MARITIME PROVINCES**

The whole of Cape Breton and a large portion of the coal and gold fields of Nova Scotia have been reported upon and mapped on a scale of 1 mile to 1 inch. The remaining portions of the province, together with New Brunswick and Prince Edward Island, have been reported upon, and, in the case of the two latter provinces, mapped on a scale of 4 miles to 1 inch.

### **QUEBEC**

Quebec, south of the St. Lawrence, has been reported upon and mapped on a scale of 4 miles to 1 inch. Many reports and maps dealing with portions of the province north of the St. Lawrence are also available.

### **ONTARIO**

A large part of the province of Ontario, more particularly the northern and western portions, has been reported upon and mapped.

### **THE PRAIRIE PROVINCES**

Geological maps and reports have been issued covering the greater part of the provinces of Manitoba, Saskatchewan and Alberta.

### **BRITISH COLUMBIA**

The southern portions of British Columbia, as well as other parts of the province, have been reported upon and mapped.

### **YUKON**

Many of the important areas in the Yukon have been reported upon and mapped.

### **THE NORTH-WEST TERRITORIES**

Many reports and maps dealing with the outlying territory of Canada have been published.

Single copies of reports and maps are sent to Canadian applicants free of cost and to others a cost of publication.

A complete list of publications will be sent free to any applicant.

Applications should be addressed to *THE DIRECTOR, GEOLOGICAL SURVEY, OTTAWA, ONT.*

### **THE FOLLOWING REPORTS AND MAPS HAVE BEEN ISSUED DURING THE PAST YEAR**

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Ontario's Mining Lands

---

The Crown domain of the Province of Ontario contains an area of over 100,000,000 acres, a large part of which is comprised in geological formations known to carry valuable minerals and extending northward from the great lakes and westward from the Ottawa river to the Manitoba boundary.

Iron in large bodies of magnetite and hematite; copper in sulphide and native form; gold, mostly in free milling quartz; silver, native and in other forms; zincblende, galena, pyrite, mica, graphite, corundum, talc, marl, brick clay, building stones of all kinds and other useful minerals have been found in many places and are being worked at the present time.

In the famous Sudbury region Ontario possesses one of the two sources of the world's supply of nickel, and the known deposits of this metal are very large. The allied metal, cobalt, is also found in Ontario in unsurpassed quantities.

The output of iron, copper, nickel, silver and cobalt in 1906 was much beyond that of any previous year, and large developments in these industries are now going on.

In the older parts of the Province, salt, petroleum and natural gas are important products. The cement and clay industries have a large output.

The mining laws of Ontario are liberal, and the prices of mineral lands low.

The climate is unsurpassed, wood and water are plentiful, and in the summer season the prospector can go almost anywhere in a canoe.

The Canadian Pacific and other railways run through the entire mineral belt.

For reports of the Bureau of Mines, maps, mining laws, etc., apply to

**HON. FRANK COCHRANE,**

Minister of Lands, Forests and Mines,  
**Toronto, Canada.**

# PROVINCE OF QUEBEC

The attention of Miners and Capitalists in the United States and Europe is invited to the

## Mineral Territory Open for Investment in the Province of Quebec

Gold, Silver, Copper, Iron, Asbestos, Mica, Plumbago, Phosphate, Chromic Iron, Galena, Etc. **Ornamental and Structural Materials in abundant variety.** The Mining Law gives absolute security to title and has been specially framed for the encouragement of mining

All mines belong to the Government of the Province on all unsold lands and on all those sold since the 24th July, 1880, but gold and silver are always reserved whatever may be the date when the land was sold, unless it be otherwise mentioned in the patent.

The Government grants **PROSPECTING LICENSES** for lands on which the mines belong to it, giving the holders of such license the first right to purchase the mines. In the case of lands where the surface only is sold, the owner of the surface may be expropriated if he refuses an amicable settlement.

The price of prospecting licenses is \$5.00 per hundred acres on surveyed lands and per square mile on unsurveyed lands. If the surface has already been sold, the price is only \$2.00. They are valid for three months and are renewable at the discretion of the Minister.

When mines are discovered, they can be bought or leased from the Government. The purchase price is as follows:—

On lands situate more than 20 miles from a railway in operation, \$10.00 per acre, and on lands situate less than 20 miles from such a railway, \$20.00 per acre.

Superficial products and building materials are sold \$2 and \$4 an acre according to the distance from rail road.

**MINING CONCESSIONS** are sold in entire lots in surveyed townships or in blocks of not less than 100 acres in unsurveyed territories.

Patents are obtained subject to the following conditions: The full price must be paid in cash; specimens must be produced and accompanied by an affidavit; a survey at the cost of the applicant must be made on unsurveyed

lands; work must be bona fide begun within two years and \$500.00 spent for each 100 acre concession.

**MINING LICENSES**, giving the right to work the mine and dispose of its products, are granted on payment of a fee of \$10.00 and a rent of \$1.00 per acre per annum. Such licenses are valid for one year and are renewable on payment of the fee and of the same rent. They may cover from 1 to 200 acres or one and the same person, and must be marked out on the ground by posts.

The description or designation must, however, be made to the satisfaction of the Minister.

Persons working mines must send in yearly reports of their operations to the Government.

The attention of the public is specially called to the new territory north of the height of land towards James Bay, which comprises an important mineral belt in which remarkable discoveries of minerals have already been made, and through which the new Transcontinental Railway will run.

The government has made special arrangements with **MR. MILTON L. HERSEY**, 171 St. James St. Montreal, for the assay and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. Tariffs of assays can be obtained on application to him.

The Bureau of Mines, at Quebec, will give all the information asked for in connection with the mines of the province, and will supply maps, pamphlets, copies of the law, tariff of assays, etc., to all who apply for same.

Applications should be addressed to:

**The Hon. Minister of Colonization, Mines and Fisheries**  
Parliament Buildings, Quebec.

# The Mining Manual 1909

By WALTER R. SKINNER

The Standard Reference Work on Mines

**Price 21/- Post Free**

1,600 pages. In Demy 8vo., Handsomely bound in RED Cloth

A record of information concerning

MINING COMPANIES (Gold, Diamond, Silver, Copper, Tin, Iron and other Mines, Collieries, Land and Exploration Concerns, &amp;c.),

Arranged in three sections—AUSTRALASIAN, AFRICAN, MISCELLANEOUS,

Preceded by TABLES OF CRUSHINGS, and followed by lists of

DIRECTORS, SECRETARIES, MINING and CONSULTING ENGINEERS, and MINE MANAGERS,

Their Names, Addresses, and Descriptions, and Names of the Companies with which they are connected, and a

DICTIONARY OF MINING AND OTHER TERMS.

The Mining Manual for 1909 contains particulars of over 3,500 Companies arranged in three sections, 450 Companies being AUSTRALASIAN (including Western Australia, Queensland, Broken Hill, Deep Leads, New Zealand, and Tasmania); 1,000 AFRICAN (including Transvaal, Cape Colony, Natal, Rhodesia, West Africa, Egypt); and 2,050 MISCELLANEOUS (including Siberia, Mexico, India, British Columbia, America, &c., and the Coal, Iron, and other mining concerns of the United Kingdom). The particulars given of each Company include the Directors and other officials; date of establishment; seat of operations; description of the property, with the purchase consideration; plant erected or in course of erection; present working results; ore reserves; details of capital; calls; dividends paid; and the financial position as disclosed by the accounts. Highest and lowest prices of the shares for the last four years, and latest price. The three sections extend over 1,100 pages.

Crushing tables and Gold Outputs from the principal mines are given at the commencement of the volume, showing tons treated monthly, results obtained and yield per ton; also annual yields.

The Lists of Directors (7,000), Secretaries (1,750), Mining and Consulting Engineers and Mine Managers (1,300), include their addresses and descriptions and names of the Companies with which they are connected.

A complete Alphabetical Index containing the names of 5,320 Companies, including many useful items of reference, occupies 43 pages.

Gold Medal—Coal and Coke—Lewis & Clark Exposition, 1905.  
 Silver Medal—Coal and Coke—Paris Universal Exposition, 1900.

Mines and Coke Ovens at Fernie, Coal Creek, Michel and Carbonado.

Annual Capacity of Mines, 2,000,000 tons. Coke Ovens, 50,000 tons.

We are shipping domestic coal to points in Manitoba, Alberta, Saskatchewan, British Columbia, Montana, Washington and Idaho, a territory of over 400,000 square miles, and WE ARE GIVING SATISFACTION.

We are shipping steam coal from Winnipeg to the Pacific Coast, and not only is it used in that vast area by the Railways and the largest firms, but also by the Great Northern Steamship Company's liners plying between Seattle and the Continent.

Our Michel Blacksmith coal is used in Railway forging shops in Winnipeg, seven hundred miles East, and in Vancouver, four hundred miles West.

Ask a British Columbia smelter Superintendent what coke he uses, and what coke gives him best satisfaction.

## Our Analyses Speak for Themselves.

## Synopsis of Canadian North-West Mining Regulations

**COAL**—Coal mining rights may be leased for a period of 21 years at an annual rental of \$1 per acre. Not more than 2,560 acres shall be leased to one individual or company. A royalty at the rate of five cents per ton shall be collected on the merchantable coal mined.

**QUARTZ**—A person 18 years of age, or over, having discovered mineral in place may locate a claim 1,500 x 1,500 feet.

The fee for recording a claim is \$5.

At least \$100 must be expended on the claim each year, or paid to the mining recorder in lieu thereof. When \$500 has been expended or paid, the locator may, upon having a survey made, and upon complying with other requirements, purchase the land at \$1 per acre.

The patent provides for the payment of a royalty of 2½ per cent. on the sales.

Placer mining claims generally are 100 feet square; entry fee \$5, renewable yearly.

An applicant may obtain two leases to dredge for gold of five miles each for a term of twenty years, renewable at the discretion of the Minister of the Interior.

The lessee shall have a dredge in operation within one season from the date of the lease for each five miles. Rental \$10 per annum for each mile of river leased. Royalty at the rate of 2½ per cent. collected on the output after it exceeds \$10,000.

**W. W. CORY, Deputy of the Minister of the Interior**

# Straight-Line Steam Driven Air Compressors

This Compressor was designed to meet the demands for a portable self-contained machine of simple construction, yet capable of operating efficiently with the least amount of erection, attention, or repairs. It is extensively used for mining, prospecting, and where an undeveloped property does not warrant great initial outlay, rock excavation, and other contracting work, structural steel or timber erection, pumping and, to a limited extent, in small industrial plants where circumstances will not permit of the installation of a Duplex Compressor and belt power is not available.

The Class "C" Compressor is of the double connecting rod type. It contains many distinguishing features from other machines of the same type. Comparison with straight line compressors with box beds will show that instead of the cylinders being bolted to the bed and held in place by dowel pins, with consequent shearing strains on the frame bolts and liability to get out of line, the cylinders and frame are bolted together with vertical flanged joints, thus producing a machine of the strongest possible construction. The frame is carried up to the tops of the cylinders, giving strength at the point of greatest strain, in contrast to machines of the box bed type which are cut away at that point and require tie rods between the cylinders to keep them rigid. Owing to our self-contained design very little foundation is required.

We cannot give here a full comparison of the machine with others of the same type, but our latest catalog contains a complete description. Send for a copy.

All equipment is built in the Angus Shops at Montreal from the most modern designs, embodying every improvement known to practical railroading.

**R. L. THOMPSON, District Passenger Agent, - - Toronto**

# DRY CONCENTRATION

## Absolutely Dustless

## The Behrend System

The Behrend Dry Concentrator is a portable and very durable machine, requiring only  $\frac{1}{2}$  horse power to operate. Capacity 8 to 15 tons per day, according to sizes of material under treatment, averaging about 12 tons.

Will recover 80 to 90 per cent. of values; is applicable to a wider range of ores and minerals than any other system; requires no skilled labor.

Makes clean separation of zinc and lead sulphides. Works equally well on ores of all sizes from 8 to 100 mesh, and saves the slimes.

Unrivalled as a clean-up machine in placer work, recovering the black sand, gold and platinum.

The usual dust conditions peculiar to dry concentration are entirely eliminated.

Write us for descriptive pamphlet. Forward sample of your ore for preliminary test.

**Canadian Behrend Dry Concentrator Co. Ltd.**  
OFFICE, Citizen Building, OTTAWA, ONT.  
Test Plant, 48½ Inspector Street, Montreal, Canada.

## Underwood

During the past four years the public has thrown away thousands upon thousands of dollars by buying imitations of the Underwood typewriter and soon afterwards exchanging them at a fraction of their cost for the original, genuine article.

No matter what machine you have used, or now use, the typewriter you will ultimately buy is the Underwood.

## RENOLD CHAINS

FOR LINESHAFT DRIVING

**1. Efficiency.** Puts 98% of the power of the motor into the lineshaft.

**2. Economy.** Saves its first cost in a year or two by overcoming the loss by slip in belt drives from motors.

**3. Reliability.** Adopted by the leading steam engine builders to drive the governors of the largest engines, as it can be absolutely depended upon.

**4. Durability.** The works of Hans Renold, Ltd., are about half belt and half chain driven, and they find the chains outlast a couple of belts, but with the new improvements recently made will probably do considerably better than this.

**5. Saving in Space.** Chain sprockets are 30 to 50% less in diameter, 50 to 80% less in width, and it is the only drive suited to short centres.

**6.** The only satisfactory method where oil, moisture or heat are present.

**7. Production** Owing to the steady positive drive, machines can be considerably speeded up, giving a larger and better product. In several large works this increase amounting to over 20%.

**8.** We now have a number of business friends in Canada who after giving the chains a trial are enthusiastic supporters.

### FREE TRADE IN COAL.

The principal desideratum in discussing questions of public interest is that there be first of all a correct conception of the issue or issues under consideration. Superficial views, arguments based upon incomplete and inaccurate knowledge, are equally mischievous. And it must always be remembered that we have to deal with things as they are. Neither the weakness of opportunism nor the counsel of perfection is needed. If any situation be fully and fairly presented, it is robbed at once of half its danger.

It is not our intention here to attempt an adequate outline of the question of free trade in coal between the United States and Canada. We hope in later issues to take the subject up in as exhaustive a manner as possible. Just now, however, it is intended merely to indicate a few facts that are apt to be overlooked.

The coal industries of Nova Scotia, as has been mentioned specifically in a former editorial, provide a livelihood, directly and indirectly, for many thousands of people. They furnish almost fifty per cent. of the revenue of the province. They have been built up, under competitive conditions, to supply a Canadian demand with a Canadian article. In developing the St. Lawrence trade large discharging and storage plants have been erected at Quebec and Montreal, and the market has been held with difficulty, in spite of the tax against United States coal.

The trade with the Atlantic States is less than five hundred thousand tons. The St. Lawrence trade is considerably more than two millions of tons per annum. Both markets are competitive.

It is admitted that free trade in coal would force Nova Scotia to abandon the St. Lawrence market and confine her attention to the New England and other Atlantic coast States. Is this exchange fair? What would it mean immediately? What would it mean in the more distant future? And, most vital of questions, to whom would the benefit of the exchange actually accrue?

We shall not attempt to answer these questions finally. It will suffice to point out once more that the United States domestic market is now in a very poor condition, and that United States producers are prepared to swamp their Canadian competitors in both markets. This would mean temporarily cheaper coal to Canada. It would also mean huge permanent loss to investors in Nova Scotian collieries, distress and want to thousands of Canadian citizens, and, probably, the destruction of Nova Scotia's most important industry. Incidentally, the development of New Brunswick's coal fields would be indefinitely postponed. Millions of Canadian money would go to the United States.

Cheaper coal would be an incalculable boon to Ontario manufacturers. The removal of the present import tax is, however, no guarantee of cheaper coal. Ontario is not a competitive market.

The surrender of our Eastern markets to the United States can, therefore, be compared to certain diplomatic bargains that are matters of Canadian history.

On the other hand, the opening of the Western States to the free importation of coal and coke from Alberta and British Columbia appears to be inevitable. Our Western Provinces have the coal; the Western States have the market, and only negligible coal deposits of their own.

Canada is fast attaining nationhood. Canada will never reach a position of importance in any way commensurate with the richness of her natural resources until Canadians have learned that these resources are not exhaustless—that they must be conserved wisely and well. We have wasted our forests, we have depleted our fisheries, we have sold part of our coal lands in the West for a mess of politics.

When our powerful neighbour to the south yearns for admission to our market, we can, without discourtesy, demand time for full investigation.

Commercial independence is not without its value. A group of gentlemen at Washington need not be reminded of this.

### ELIMINATION OF POLITICS.

In governmental departments, especially in those that employ technical workers, whatever makes for appointment of new officers on their merits makes also for the good of the service. Political influence is the fly that causeth the ointment to be unsavory.

We are gratified to note that political influence is not a factor in appointments made to the staff of the Geological Survey of Canada. Whatever may have been the case in the past, at all times it must have been most repugnant to directors to have unqualified assistants foisted upon them.

The Director of the Geological Survey has issued a short, pointed, and unequivocal form of regulations governing the appointment of assistants to field parties, positions much coveted by youths ambitious and otherwise.

All assistants must have passed at least their second year examinations in the special departments of geology, mining engineering, or surveying, in a Canadian mining school or university, or some other approved higher educational institution, before taking the field. They must be men of good physique. Preference will be given to those with some knowledge of bush work.

Amongst other restrictive clauses, the most important is this: "Each applicant must sign a statement with his application that it is his intention to become

a professional geologist, mining engineer or topographer."

"These regulations," announces the circular, "must be adhered to."

This action should meet with strong approval. Canadian universities are turning out scores of mining and geological graduates. Second and third year men are every summer looking for suitable employment. Heretofore it has not been unusual to find Geological Survey parties recruited with medical students, budding theologians, embryonic lawyers, and unlabelled nondescripts. Vigour, tone, and permanence will be lent to the service by keeping its ranks free from rank outsiders.

### NOVA SCOTIA'S MINING REPORT.

A gratifying improvement over its predecessors is noticeable in the annual report of the Department of Mines of the Province of Nova Scotia for 1908. Typographically and in all other respects the 1908 report is distinctly superior to those of other years. This is no small matter. It means, first of all, that the Department is bestirring itself. Also this report will arouse far more interest than would have been possible had the old form been adhered to.

Nova Scotia has large and varied sources of mineral wealth. Providence has ordained that the winning of this wealth should not be easy, and that each of the Province's mineral industries should have its own difficulties and hindrances. The people of Nova Scotia are able to work out their own destiny. If they are to succeed in building up a mining industry that shall be commensurate with Nova Scotia's natural resources, they must grapple earnestly with fundamental problems. The men at the head of their Department of Mines are thoroughly familiar with the needs of the industry. The Department itself needs the vigorous support of an awakened public.

### MINING ACCIDENTS.

Mr. Ralph Stokes, whose letter appears on another page, has visited nearly all the more important districts of the British Empire. As a representative of a group of South African, English, and United States papers. Mr. Stokes undertook, a few years ago, to visit and describe the mines of the British Empire. His large and entertaining volume, "Mines and Minerals of the British Empire," has already assumed a place in the world of technical literature. Equally is it a useful record of travel in unfrequented ways.

Mr. Stokes refers to "the influence of more capable and scientific supervision," as indicated by "the large decrease of accidents due to explosives, which class of mishap is above all attributable to carelessness or inefficiency."

**THE McCHARLES PRIZE.**

The late Aeneas McCharles, a native of Cape Breton and for many years a citizen of Sudbury, Ont., was deeply impressed with the importance of improving our modern means of extracting metals from their ores, or of treating minerals generally. To stimulate Canadians to attack the problems of metallurgy and ore-dressing, Mr. McCharles set apart in his will a fund of sufficient bulk to provide a prize of \$1,000 to the Canadian who does most in any one year to advance the sciences mentioned above.

The drafting of regulations was left in the hands of the Board of Governors of the University of Toronto. These are printed on another page, and should be read carefully.

The McCharles prize should set every young eligible Canadian thinking.

**A RESOLUTION.**

The following resolution has been forwarded to Ottawa by Secretary Hayward:—

"The Mining Society of Nova Scotia beg to congratulate the Government of Canada on the resumption of the important portfolio of Minister of Mines by the Honourable William Templeman, and have confidence in assuming that the vigorous and wise policy which has brought such signal and beneficial service to the Western Provinces will be extended to Nova Scotia."

In connection with the above we are informed that the Minister of Mines intends to visit Nova Scotia officially during the current year.

Mr. R. B. Watson, manager of the La Rose and Nipissing, paid a visit to Gowganda recently to look over some of the prospects.

## PROBABLE EFFECT OF THE ACREAGE TAX ON MINING LANDS IN ONTARIO.

Paper read by G. R. Mickle before the Canadian Mining Institute, Montreal Meeting, March, 1909.

In order to estimate the effect the acreage tax levied by the Supplementary Revenue Act, 1907, will have, it is necessary to understand not only this Act, but also the conditions under which mining lands have been patented or leased from time to time in Ontario. This Act imposes a tax of two cents per acre on all lands patented or leased for mining purposes, situated in territory having no municipal organization. The tax is a statutory one, no notice or tax bill is, therefore, required. A penalty of 10 per cent. attaches if the tax is not paid by the date specified (October 1st, each year), and after a certain time the lands in default with regard to taxes are forfeited after notice is published in the Ontario Gazette. The Act requires that a tax roll should be prepared showing all the lands taxable. This will be referred to frequently in the course of this paper.

A synopsis of the various Acts and regulations is given in Volume II, Report of Bureau of Mines. Previous to 1867, when Ontario was formed into a separate province, mining lands were disposed of under Orders-in-Council. It was intended originally to grant five square miles, or 3,200 acres, but this was never carried out, and the first grant of land as mining land was in a location of ten square miles, or 6,400 acres, the block being 5 x 2 miles, five miles being laid out along the supposed course of the vein. In those days they must have had great veins. The first "location" granted in this way was the Cuthbertson (Bruce Mines), containing 6,458½ acres, and the patent is dated at Quebec on the 5th October, 1852. In the case of islands or areas broken by any natural obstacle, the location might exceed or be less than 6,400 acres, and accordingly there appear on the tax roll to-day 22 locations containing in all 132,685 acres, the largest being 9,793 acres and the smallest 1,130. The land was sold at 80 cents per acre, and payments spread over a number of years. Priority of discovery was a first requirement.

In 1853 the regulations were changed so that by securing a license to explore good for two years and

costing \$100.00 the licensee might secure an area not exceeding 400 acres, which must afterwards be purchased at \$1.50 per acre. Subsequently the license fee was abolished and the land went to the first applicant under working conditions. These conditions were afterwards eliminated. In 1864 the Gold Mining Act was passed (27 Vict., Chap. IX.) by the Legislature of the United Provinces. This Act was occasioned by the gold excitement on the Chaudiere and other rivers in Quebec, and provided for the setting aside of mining divisions wherein licensees might stake out claims of small area (less than one acre). Under the regulations existing from 1853 to 1869 about 35,000 acres of land were granted in parcels of 400 acres or thereabouts, which now appear on the tax roll. The area of these locations in organized territory has not been ascertained.

In 1869 the first really important Mining Act was passed in Ontario (32 Vict., Chap. 34). The area of mining locations was fixed at 320,160 or 80 acres. Regulations were also contained in this Act for the declaration of Mining Divisions as in the Act of 1864, the area being 200 feet square or about one acre. Neither discovery or work was required to hold mining lands acquired by purchase, the Act simply stating "Crown Lands supposed to contain mines or minerals may be sold as mining lands," or they might be worked as mining claims if in a declared mining division.

In 1891 the Public Lands Act (54 Vict., Chap. 7) was amended, so that the mineral rights were declared reserved in grants of land for agricultural purposes, even if the reservation was not expressly mentioned.

The Mines' Act, 1892 (55 Vict., Chap. 9) is the next important one, no substantial change was made in the size of the locations except that they might be 320, 160, 80 or 40 acres. The system of leasing whereby a part of the rental money might be applied on purchase was made a feature of this Act. Working conditions were included (\$4.00 per acre during 7 years). The provisions regarding mining claims staked by licensees in

mining divisions were retained, the area being from 5 to 20 acres, according as one or more persons were involved.

By the Act of 1897 (60 Vict., Chap. VIII.), discovery was introduced and the amount of land one person might apply for in one year was restricted. Working conditions were maintained.

By the Mines' Act of 1906 (6 Edward VII., Chap. XI.), the whole province where any Crown lands were left was divided into mining divisions. (See Section 79.) The mining location, therefore, automatically disappeared and the mining claim is limited to a maximum of 40 acres. The time in which the purchase price may be paid is three years after application. By the Act of 1897 in the case of mining locations it was three months. (Sec. 37.)

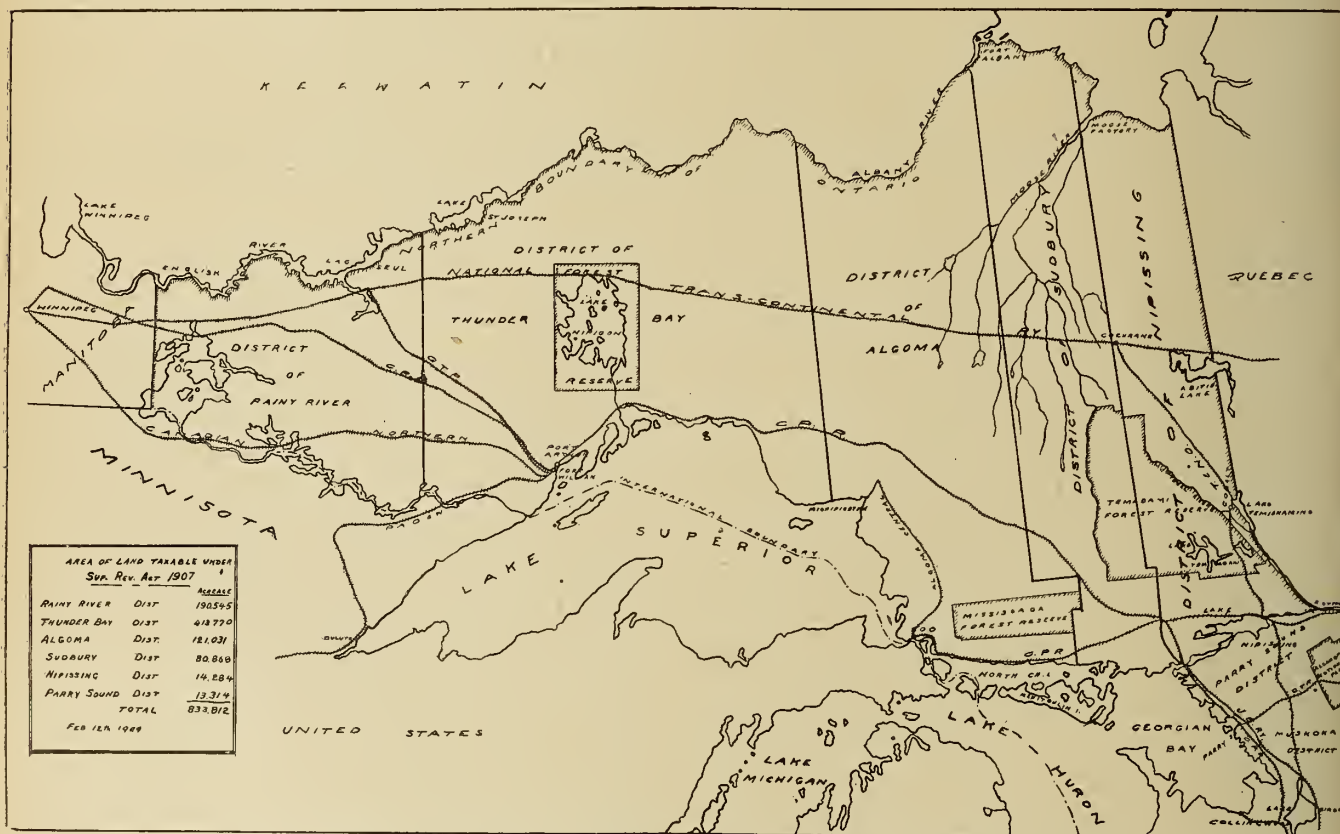

It was stated above that only lands in territory with

land is not suited for agriculture and mining is not actively pursued, no stable population can exist and no municipalities can be formed, and the land, therefore, remains on the tax roll. In general, therefore, a large taxable acreage indicates a backward state of mining.

Coming now to the map, in which the Judicial districts have been adopted in dividing up the province, as these are more likely to remain unchanged for a time than the mining divisions, the acreage of taxable land is given in each.

In Rainy River District the maximum size of any location is 320 acres except in case of broken fronts. Nearly all this land was taken up during the gold excitement of 1896 to 1900. There are also a great many acres bought for iron lands.

Thunder Bay contains about half the total taxable area of the Province, and includes most of the large

Map of Northern Ontario, showing area of lands taxable under Supplementary Revenue Act, 1907.

no municipal organization was taxable. In order to form a municipality it is necessary to have a certain minimum of population; thus the "Act respecting the Establishment of Municipal Institutions in Territorial Districts" (Chap. 225, R.S.O. 1897, Vol. 2) provides that a surveyed township or unsurveyed territory not exceeding 20,000 acres in area and with a population of not less than 100 persons may be formed into a municipality on petition of not less than 30 persons to a district Judge, who is required to call a meeting. At this meeting not less than 30 freeholders or householders must be in favor of forming the municipality. It requires therefore a population of a stable character such as can only exist where there is steady occupation. Lumbering operations, for instance, except those in connection with manufacturing lumber, are not likely to produce the necessary conditions and there remain then practically only agriculture and mining. If the

locations of 6,400 acres mentioned before. The balance of these are in Algoma. As stated before, there are 22 of these immense locations on the tax roll, containing in all 132,685 acres. Seven more than this were patented with 42,418 acres which are now within organized municipalities, making 175,103 acres granted in this lavish way. These seven large locations (6,400 acres) happened to be situated where there was agricultural land and it is due to this that there was sufficient population to form municipalities.

The same conditions hold true in Algoma to a lesser extent. In this district there is also a large area of Indian lands which have been patented by the Dominion Government. As the form of patent does not convey the mineral rights expressly, and gold and silver are reserved in the Dominion Lands Act, it has been held that Indian lands are not taxable under the Supplementary Revenue Act.

In the Sudbury district more municipalities have been formed, many of the townships having sufficient stable population to organize municipalities, solely or mainly on account of the mining industry.

Nipissing, which includes the Temiskaming and Montreal River mining divisions, where there has been such a great mining activity for the last three or four years, shows a very small taxable area comparatively. This is due to several reasons. In the first place most of the mining land has been staked under the Act of 1906, according to which, after staking, a mining claim may be held for three years without patenting provided the working conditions are fulfilled, consequently these claims do not appear on the tax roll. Then a great deal of the land that was applied for previous to 1906 was under the regulations governing mining divisions in the Act of 1907. A claim, therefore, could not exceed 40 acres. Moreover, the successful mining operations have attracted a population sufficient to form municipalities and consequently many of the claims patented would not be found on the provincial tax roll. More municipalities will doubtless be organized, and even when a proportion of the great number of claims now existing are patented, there will probably be no very great area subject to provincial taxation for any length of time.

The Larder Lake section, although something like 4,000 claims were staked there, shows very few patented ones, although it is over two years since the heavy claim-staking took place there.

In Parry Sound, to which Muskoka is added, a great many acres have been bought as mining lands by lumbermen previous to 1897. This was only done to secure sufficient land to pasture their stock. If applied for as agricultural land settlement duties would have been required and only a limited area of 200 acres would be granted.

The effect of this acreage tax cannot be fully determined till the time for forfeiture arrives. According to the Act the earliest date at which that can take place is the 30th June, 1910. At the present time a little over half the total area is in good standing with regard to taxes. Judging from the correspondence received and the way payments come in most of the owners intend to retain their mining lands. As a maximum I would consider 200,000 acres might be forfeited and a minimum of 100,000. In some cases the land belongs to insolvent estates, it is, therefore, not in the interest of anyone in particular to keep up the taxes. In many instances also, the owners acquired the land in time of an excitement and have lost all interest in it now.

## Translation of Article by O. Stutzer, of Freiburg, in the "Zeitschrift Fur Praktische Geologie," December, 1908.

In the beginning of May of this year I visited the great cobalt-silver deposits of Temiskaming in Canada. These deposits are fully described by Dr. Miller in his well-known report, "The Cobalt-Nickel Arsenides and Silver Deposits of Temiskaming," 1908.

In Cobalt they regard the diabase which occurs there as the source of the ore, and this belief is founded on the close relations which exist between the diabases and the ore veins in that district. Moreover, the occurrence in Sudbury strengthens this belief, as the nickel ore there occurs in norite, which is a rock closely allied to the diabases. The only other eruptive rock known in Cobalt is the granite. This granite was even in pre-Huronian time partly solidified, but remained active for considerable length of time in greater depths, as can be seen from the younger granite dyke in the southwest corner of the University mine at Giroux Lake. Here the diabase is cut through by the granite. In this granite area I suspect the source of the cobalt-silver ores. The analogy with other occurrences of this type of ore, where the granite is the source of the cobalt-silver ores, leads one to this, and especially may be mentioned the similar occurrence in the Harz Mountains, Joachimsthal, and Annaberg and Schneeberg. The source of the ore there is the granite of Eibenstock, which is rich in alkalis. Also Chalanches, in France, and Wittichen, in Schwarzval. The granite is probably connected genetically with the cobalt-silver ores.

Of further interest is the question of the influence of the country rock on the ore bodies. It is known in Cobalt that the veins in diabase and in the deeper lying Huronian conglomerate carry silver, but in the still deeper lying Keewatin there is generally only cobalt and nickel. Miller explains this, page 33 of his report, third edition, somewhat in the following manner:—

After the deposition of the cobalt-nickel arsenides the cracks were split open again, and so prepared a

way for the percolation of the silver-bearing solutions and deposition of silver.

The rocks of the Keewatin are tougher than those of the Huronian, and therefore this second cracking was confined to the latter rock, that is, Huronian. In consequence of this we find the silver ores only in the higher-lying series of rock. The source of the silver-bearing solutions is not regarded in this supposition as a leaching product of rocks which lie higher, but as a primary deposit of post-volcanic springs in connection with the eruption of the diabase.

According to my view, the origin of the cobalt-nickel-silver ores is not divided in point of time, although most silver and calcite belong to the youngest minerals in the vein. One can collect hand-samples in which the silver is intimately inter-grown with smaltite, which only permits a simultaneous formation of both minerals. As an example of this may be mentioned some pieces of ore in the Trethewey vein. In these pieces it is seen especially well in thin sections, the aborescent silver forms being embedded in the massive smaltite. The shape of the solid silver resembles dendritic forms. It cannot be regarded, however, as a thin deposition of silver in a crack.

If we suppose that there is a relatively simultaneous origin of the different ores, then where we have cobalt-nickel ores we should have silver, too, but that is not the case. In the diabase and in Huronian we find silver, but generally not in the Keewatin, and I was even told that on passing from the Huronian conglomerate to the Huronian slates the silver values are lost, but appear again on coming back into the Huronian conglomerate. The country rock must, therefore, in Cobalt, have had an influence on the precipitation of the ore out of the solutions. This brings to mind the fahlbands of Kongsberg, in Norway. Those fahlbands are zones of rock impregnated with pyrites, which are cut through by

ore veins. The veins are rich in silver only at the junctions with the fahlbands. This phenomenon is best explained as the consequence of electrolytic process. The electrical currents in the earth circulated most intensely through the zones of rock which are impregnated with pyrites and precipitated electrolytically the ores out of the solutions.

In Cobalt the diabases and the different conglomerates perhaps acted as precipitants. The diabase carries a good deal of magnetite, and the Huronian conglomerate has in places a considerable amount of pyrites. This supposition is, however, not entirely satisfactory, as there is a good deal of diabase material in the Keewatin. The Keewatin is certainly decomposed and greatly folded or sheared. At any rate, it would be an interesting task to test the electrical conductivity of the different rocks of Cobalt on the spot.

#### Comments on Mr. Stutzer's Article.

It is easily seen that Mr. Stutzer understands the points to which attention should be paid in a camp like Cobalt. His visit was, however, brief, and the regional geology new to him, hence it is not surprising that some of his conclusions should not be correct. For instance, he says that "This granite (Laurentian) was, even in pre-Huronian time, partly solidified," etc. The granite was not only solidified, but it and the Keewatin series were subjected to profound erosion. The granite dike of the University property, to which Mr. Stutzer refers, belongs to a much later period of eruption. It is considered to represent the acidic residue of the post-Middle Huronian diabase. Similar dikes are quite numerous in the Montreal River area. A vast period

of time elapsed between the intrusion of the Laurentian granite and that of the granite dike of the University.

Mr. Stutzer infers that "granite is the source of the cobalt-silver ores." Of course this has been the accepted theory in Europe, but anyone who has carefully studied the association of diabase with these ores in Ontario is forced to conclude that the metals were contained in the original diabase magma. When the Cobalt district was first studied it was only to be expected that these somewhat unique ore deposits would be compared with those to which Mr. Stutzer refers in Europe. It was well known what explanation had been given as to the source of the metals, but experience of deposits over a wide area in Ontario shows that the European theories of origin are not applicable, at least, to the Ontario deposits.

Mr. Stutzer refers to the possible influence which country rock may have had on the ore bodies. This point was carefully studied at Cobalt, but it was decided that the country rock had no special significance. Much of the Huronian slate and conglomerate is similar in composition to the Keewatin, from which a large percentage of the material in the Huronian has been derived by erosive agencies. Hence if the Huronian is proved to be a good precipitant for such solutions the Keewatin should have a similar effect. There is no doubt that there have been two periods of disturbance, but the cobalt and nickel were not all deposited in the veins during the first period. The solutions gradually changed; some of the silver components, such as the silver sulph-antimonide and arsenic which occur in small quantities, may belong to the earlier period of decomposition. Much the greater part of the silver was deposited after the second period of disturbance.

## EARL GREY'S ADDRESS AT THE C.M.I. ANNUAL DINNER.

His Excellency said he was glad to be able to attend the annual dinner of the Canadian Mining Institute. It was a comparatively young organization, but growing rapidly. In 1898 it had only 63 members; now it had nearly 900.

The mining industry of Canada had only just begun. Until recently, agriculture was the sole industry. The first prospectors and miners were necessarily agriculturists, with no knowledge of mining; consequently mining propositions which under good management and transportation facilities would have been successful, turned out failures, owing to the want of transportation, skilled workers, and intelligent direction. These deficiencies, which interfered with successful mining a few years ago, were now to a great extent removed.

That great Canadian, Professor Grant, whose influence has left so deep an impression on the life of Canada, recognized the want of a school of mining. He opened a school at Kingston in 1893, which has exerted a marked influence on technical education in this country. The mining departments of McGill and Toronto have also done much to supply trained men to intelligently develop the country's mineral resources.

The mineral production of \$10,000,000 twenty years ago had nearly trebled to \$28,000,000 in the next ten years, and that amount had again more than trebled in the last decade to \$86,000,000 for 1907.

The mining industry, like all others, has been checked in its rate of growth in the year 1908 owing to financial stringency and lower prices of silver, lead and copper, but the output of 1908 had exceeded that of 1907, and nothing could be more certain than that the increase in the total value of minerals produced in Canada during the next twenty years would be as great as that which had taken place in the last twenty years.

He understood the object of the Institute was to place the mining industry of Canada upon an efficient and honest basis; to meet both professional and educational requirements; to educate the prospector as well as the mining engineer; to turn out technical men; to provide them with opportunities for exchanging their views and studying each other's methods; and to make the full membership of the Institute a guarantee of both knowledge and, what was far more important, character.

He was informed that the members of the British and foreign mining associations who visited Canada in 1908 had been greatly impressed with the extent of unprospected area in the Dominion, with the magnitude of operations, and with mechanical appliances in operation at Grand Forks and other places. The visit had been mutually advantageous. The visiting experts made some practical suggestions, and also acquired some good ideas.

One result of the visit of the British Mining Associ-

ation, of great benefit to Canada, would be that trustworthy information about Canadian mining propositions would now be obtainable in London, with the result that the mineral industry of Canada would be better safeguarded than hitherto against artificial booms, followed by unjustifiable slumps.

His Excellency, while confessing that his personal sympathies were more with agriculture than with mining, willingly admitted that there was no industry which contributed more to the general prosperity of a country than mining. Successful mining involved increased demand for the employment of capital and labor, increased industrial developments, increased commercial activity, increased land settlement, increased railway traffic and increased national prosperity.

Although the mineral output of Canada was at present only \$12.71 per head of the population, and the agricultural output \$63.90 per head, it was quite possible that these proportions might some day be reversed.

They had, close behind them, the largest bit of unprospected country left in the world. Of the "pre-Cambrian" formation, measuring 2,000,000 square miles and covering half of Canada, they only as yet knew a little about the southern fringe. Although the existence of silver was known at Temiskaming 150 years ago, the discovery of Cobalt was only made in 1903. This discovery was an accidental result of railroad construction, as were also the nickel mines of Sudbury and the asbestos mines of Quebec, notwithstanding that the existence of asbestos had been known for some time.

Although they had only combed a little bit of the southern fringe of this great ore field, they had combed out of this southern fringe the Cobalt silver mines, the nickel mines at Sudbury, the Lake Superior iron mines—the greatest iron mines in the world, and the Michigan copper mines, which occur in the same formation which has flowed over from the Laurentians into the United States.

The rich results that had followed the partial prospecting of the southern fringe of the pre-Cambrian formation justified the expectation that in the unopened cupboard of their treasure house was greater wealth than that which had been already revealed to them, and it was quite possible that the mineral wealth of the Appalachian and Cordilleran ranges was greater still. No one could form an estimate of the riches in the unopened treasure houses of Canada. It was, however, certain that the development of the untouched mines meant great material prosperity for Canada.

The development of a silver camp meant more consumption of timber, coal, coke and limestone; more freights, more machinery, more chemicals, more miners' supplies—all involving an increase of business and of railway traffic, and a consequent advance in land values. The systematic and organized development of the mining industry of Canada was therefore a matter of national importance.

It was well known that the per capita production of men engaged in mining was greater than that of men engaged in agriculture. In Canada the per capita production of men engaged in mining was estimated as twice and a half that of men engaged in agriculture. The Government of New South Wales had published reports from their Government Statistician, Mr. Coghlan (now their Agent-General in London) that the men engaged in silver-lead mining produced more wealth and gave more employment to affiliated industries than

ten to twelve times the same number of men employed in agriculture.

His Excellency had already pointed out the importance of the mining industry to the railways. He added that it had been a surprise to him to discover that in Canada, which had been regarded as a country mainly agricultural, the business of the mines afforded 33 per cent. of the total railway traffics during the year 1907, while the products of agriculture afforded only 17 per cent., and in the United States the difference in favor of mines was still greater, the mines affording 54 per cent. of the total business done by the railways, and agriculture only 9 per cent.

The importance of developing the mining industry would thus be obvious to everyone. At present the cars which took the wheat from the Northwest to the seaports were hauled back empty across half a continent. The development of the mining industry would enable the railway companies to haul back full cars instead of empties.

Ships to Africa went full of the merchandise and machinery required for the mining industry and returned comparatively empty, because gold and diamonds made no freight to speak of. With the development of the mining industry of Canada the great railway companies of Canada might look forward to full trains both ways, and would consequently be in a position to offer lower rates to the farmers; and in addition to the new markets and cheaper transportation rates that mineral developments would bring to the Canadian farmer, the effect of the development of the mining industry would be to strengthen the population of the East, and would provide a balancing compensation to the increasing weight of the growing West, and thus help to ensure the stability of the national equilibrium.

#### MONEY FOR GEOLOGICAL SURVEY WORK.

The work of the United States Geological Survey is carried on by means of appropriations made each year by Congress, chiefly in the act providing for "sundry civil expenses of the Government," popularly known as the sundry civil act. The sundry civil act passed by the Congress which has just adjourned appropriated for the Survey for the fiscal year 1909-10 the sum of \$1,407,390, specifying that it be applied to the following purposes:—

|                                            |           |
|--------------------------------------------|-----------|
| Geological surveys .....                   | \$225,000 |
| Chemical and physical researches .....     | 20,000    |
| Mineral Resources report .....             | 75,000    |
| Topographic survey .....                   | 350,000   |
| Forest-reserve topographic surveys .....   | 75,000    |
| Water-resources investigations .....       | 100,000   |
| Structural-materials investigations .....  | 100,000   |
| Fuel-testing investigations .....          | 100,000   |
| Mine-accidents investigations .....        | 150,000   |
| Geologic maps (printing and engraving).... | 100,000   |
| Preparing illustrations for reports .....  | 18,280    |
| Books for library .....                    | 2,000     |
| Statutory and temporary salaries .....     | 88,760    |
| Mine inspectors' expenses .....            | 3,350     |

\$1,407,390

An appropriation of \$90,000 for the investigation of Alaskan mineral resources by the Geological Survey was carried in the urgent deficiency act. Other appropriations for rent of offices in Washington and for publications make the total amount provided for the work of the Survey about \$1,700,000.

## NATURAL GAS IN ALBERTA.

GAS WELL AT BOW ISLAND, ALBERTA.

7,000,000 cubic feet of gas when shot—4,000,000 when photo taken.

Railway corporations are becoming increasingly active in the development of Canada's natural resources. The Canadian Pacific Railway, which was, of course, the pioneer line through our North-West, is also engaging in large enterprises that have a most important bearing upon the future of the country. Its interests in metallurgical and coal-mining ventures are well-known. It has inaugurated comprehensive irrigation schemes. But the most striking of its recent activities have been in connection with the exploitation of the gas fields of Alberta. Of this work, directed successfully by a past president of the Canadian Mining Institute, we hope to have more to say in the near future. The present intention is to give merely an announcement of results already attained.

Under the supervision of Mr. Eugene Coste, a very important well has just been completed to the depth of over 1,900 feet. This well has proved to be a gusher of 7,000,000 cu. feet of natural gas per diem. It is situated near the banks of the South Saskatchewan River, Twp. 11—R. 11—west of the 4' meridian. The accompanying photos show the well burning at night before it was tubed and closed in. Although at the time the photo was taken the well was under full control by means of valves controlling the flow on a pipe line, it could not be closed in until high pressure test tubing valves and fittings had arrived.

Photo No. 2, taken by Mr. S. Mavor, of Glasgow, during the C. M. I. excursion last September, shows one of the wells drilled by Mr. Coste for the C. P. R. This well is at Dunmore Junction, and gets its gas from a depth of nearly 1,100 feet. We are informed that the

flow is one and one-half million cubic feet per day. The distance between the first (Bow Island) well mentioned and the Dunmore Junction well, is nearly 40 miles in an air line. This fact, especially when it is understood that the gas wells of Medicine Hat, Stairs, and Suffield are located between them, shows that already a wide gas belt has been demonstrated by the C. P. R. What effect this supply of cheap fuel and power will have upon the growth of the surrounding districts is not hard to guess. In nearly all discovered fields gas and oil succeed one another. The eventual discovery or appearance of oil would add enormously to the wealth of the country.

It is satisfactory to note that a Canadian corporation, employing a Canadian engineer, has successfully exploited this promising field. Mr. Coste is to be congratulated on the practical value of his geological diagnosis of the district.

Aplite is defined by Geikie as being a fine-grained mixture of quartz and feldspar, both of which minerals have not infrequently intergrown (micropegmatite). Aplite is found especially in veins of granite.

Out of about 150 discoveries of gold and silver in the United States and Canada, tabulated by W. R. Crane, only ten are designated "accidental." The rest, with one or two exceptions, are attributed to the intelligent efforts of the prospector. It may be significant that most of the accidental discoveries date back more than fifty years ago. The most recent is twenty-two years old.

GAS WELL AT DUNMORE JUNCTION, ALBERTA.

1,500,000 cubic feet of gas per 24 hours—September, 1908.

BOW ISLAND GAS WELL—FLAME 160 FEET IN HEIGHT.

### THE McCHARLES PRIZE.

In view of the great interest now being taken by Canadians in all developments in the natural resources of the Dominion, the bequest of the late Æneas McCharles providing a fund for the purpose of recognizing the inventions or discoveries of special merit made by Canadians will be welcomed by all.

The following extract from the will of Mr. McCharles and the accompanying regulations drawn up by the Board of Governors of the University of Toronto governing the award as set forth below, give full details concerning the prize, which will be offered for the first time this year:—

“In connection with the bequest of the late Æneas McCharles of Provincial Government bonds of the value of \$10,000, on the following terms and conditions, namely, that the interest therefrom shall be given from time to time, but not necessarily every year, like the Nobel prizes in a small way: (1) To any Canadian from one end of the country to the other, and whether student or not, who invents or discovers any new and improved process for the treatment of Canadian ores or minerals of any kind, after such process has been proved to be of special merit on a practical scale; (2) Or for any important discovery, invention or device by any Canadian that will lessen the dangers and loss of life in connection with the use of electricity in supplying power and light; (3) Or for any marked public distinction achieved by any Canadian in scientific research in any useful practical line. The following

conditions, as passed by the Board of Governors, determine the method of award:—

(1) The title shall be the McCharles Prize.

(2) The value of the prize shall be One Thousand Dollars (\$1,000.00) in money.

(3) The term “Canadian” for the purposes of this award shall mean any person Canadian born who has not renounced British allegiance; and for the purposes of the award in the first of the three cases provided for by the bequest, domicile in Canada shall be an essential condition.

(4) Every candidate for the prize shall be proposed as such in writing by some duly qualified person. A direct application for a prize shall not be considered.

(5) No prize shall be awarded to any discovery or invention unless the same shall have been proved to the satisfaction of the awarding body, to possess the special practical merit indicated by the terms of the bequest.

(6) The order of priority in which the three cases stand in the wording of the bequests shall be observed in making the award; that is, the award shall go *caetris paribus* to the inventor of methods of smelting Canadian ores; and, failing such inventions, to the inventor of methods for lessening the dangers attendant upon the use of electricity; and only in the third event, if no inventors of sufficient merit in the fields of metallurgy and electricity present themselves, to the inventor distinguished in the general field of useful scientific research.

(7) The first award shall not be made before June, 1909.”

A committee to make the award of the prize has been appointed by the Board of Governors of the University of Toronto.

It will be seen from these conditions that the Committee of Award is given a wide scope in making its selection, as the prize is open to candidates in every part of the Dominion, and is not necessarily confined to those who have made discoveries or inventions in recent years.

All communications in connection with this award should be addressed to the Secretary of the McCharles Prize Committee of Award, University of Toronto, Toronto.

### TRAFFIC TO GOWGANDA.

The following statement may be of interest as showing the amount of money that is being spent at the present time in preparation for development of the silver prospects in the Gowganda and Montreal River districts.

As everyone who is interested in that country knows, freight is taken by rail either to Charlton on the T. & N. O. Ry. or to Selwood on the C. N. O. Ry., and is then transferred to teams to be hauled to its destination.

As far as I could learn five hundred tons or more is being handled daily from Charlton to Elk City at an average rate of at least 75 cents a hundred pounds, giving a daily expenditure for freight, over and above the railway charges, of \$7,500 a day.

About one hundred tons of this freight stops at Elk City, while the remaining four hundred tons goes on to Gowganda. The average freight rate from Elk Lake to Gowganda is at least \$2.50 a hundred pounds or \$20,000 a day for the four hundred tons. This gives a total daily freight charge from Charlton to Elk City and Gowganda of \$27,500 a day, or \$825,000 a month.

It is not improbable that the value of the material laid down at Charlton is worth more than the freight charges amount to to its destination, or, in other words, that the supplies and machinery being sent into the Gowganda and Montreal River districts at present represents an expenditure in first cost and freight of something like two millions of dollars a month.

This enormous expenditure shows a very real intention on the part of those interested in mining in Ontario to prospect and develop that northern country.

J. B. TYRRELL.

9 Toronto St., Toronto.

## REPORT OF THE DEPARTMENT OF MINES, PROVINCE OF NOVA SCOTIA, 1908.

As was noted editorially in the Canadian Mining Journal, the Report for 1908 is a great improvement on its predecessors. It is clearly printed, well arranged, and amply illustrated.

The following summary shows the mineral production:—

|                                | Year ended<br>Sept. 30,<br>1907. | Year ended<br>Sept. 30,<br>1908. |
|--------------------------------|----------------------------------|----------------------------------|
| Coal raised (gross tons).....  | 5,730,660                        | 6,299,282                        |
| Pig iron (gross tons).....     | 293,436                          | 326,303                          |
| Iron ore (net tons) .....      | *630,275                         | *902,475                         |
| Limestone (net tons) .....     | 458,601                          | 484,685                          |
| Coke made (net tons).....      | 493,102                          | 505,003                          |
| Gypsum (gross tons) .....      | 332,345                          | 242,535                          |
| Gold (ounces) .....            | 15,006                           | 11,990                           |
| Bricks .....                   | 25,000,000                       | 23,000,099                       |
| Building stone (net tons)..... | 63,861                           | 45,500                           |
| Cement (barrels) .....         | 58,762                           | 44,529                           |
| Antimony ore (net tons) .....  | 1,403                            | 132½                             |
| Manganese ore (gross tons).... | **495                            | .....                            |
| Copper ore (net tons).....     | 2,471                            | 1,200                            |
| Drain pipe (feet) .....        | 300,000                          | 300,000                          |
| Grindstones (net tons) .....   | 350                              | 360                              |
| Copper (pounds) .....          | 12,320                           | 28,800                           |
| Moulding sand (net tons).....  | 190                              | 185                              |

\*Including imported ore. N. S. ore 30,575 tons.

\*\*All imported.

It will be noticed that coal, iron ore, coke, and however, was all imported, with the exception of 30,375 raised in the province. The decrease in gypsum, gold, and antimony will be referred to later.

The total revenue of the Mines Department was \$683,016.95. To this amount the royalty from coal

mines contributed \$616,933.66. Gold rentals brought in \$10,805.

During the fiscal year ending Sept. 30, 1908, the Government paid as a bonus on each ton of coal consumed in the manufacture of iron and steel in the Province the sum of \$65,294.48. The Dominion Iron & Steel Co., the Nova Scotia Steel & Coal Co., the Londonderry Iron & Mining Co. were the recipients of this bonus.

The returns of coal sold show that the principal increase was in the Quebec (St. Lawrence) trade, and in the New Brunswick and Newfoundland sales. A considerable falling off is apparent in the United States sales.

The returns of coal sold during the year 1908 show, compared with the returns of 1907, as follows:—

|                            | 1907.     | 1908.     |
|----------------------------|-----------|-----------|
| New Brunswick .....        | 427,128   | 510,331   |

### Collieries—Cape Breton.

**North Atlantic Collieries, Port Morien.**—The main haulage deep, which had 700 feet of water in it, was pumped out and extended 800 feet. Travelling road and levels were extended. Fifteen hundred feet of

double track were laid in the haulage deep. A half battery of Babcock & Wilcox boilers was installed at the main lodgment. The quantity of air in circulation is 30,000 cubic feet per minute. The workings of this mine are all submarine.

**Dominion Coal Company Collieries.**—It is out of the question to note all the changes and improvements in this company's collieries and plants. A few general notes must suffice.

Electric turbine pumps have been installed at Dominion No. 5. Extensive surface improvements have been made at many of the mines. It is pleasing to note the large amount of Canadian machinery that has been and is being installed. During 1908, Dominion No. 12 colliery was connected to Grand Lake by seven miles of railway. At all the collieries safety lamps, Ackroyd & Best and Marsaut are in use. Bulldog and excellite appear to be the principal explosives used.

At the **Nova Scotia Steel and Coal Company's Collieries**, Sydney, No. 1, No. 2, No. 3, No. 4 and No. 5, many improvements were made and outputs were increased. At No. 1 the output was 253,900 tons, in mining which amount 19,021 lbs. of powder was used. At No. 3 the quantity of 46,902 lbs. of powder was used in mining 299,374 tons of coal.

The **Mackay Mining Company** is a small concern which promises larger development. The mine has been wired for electric power, and an electric chain coal cutter is in use. The output is about 50 tons per day.

The **Colonial Coal Company** has a property once worked by the Toronto Coal Company. The mouth of the slope is less than 200 feet distant from the waters of Little Bras D'or. An extension of the I. C. R. will come within three-quarters of a mile of the mine. The old slope has been cleaned out and retimbered, and a

haulage road laid. It is expected that 200 tons per day will be shipped during the 1909 season.

**Sydney Coal Company.**—This mine output 5,000 tons in 1908, as compared with 3,000 tons in 1907. The mine is principally worked for local sales.

**Inverness Mine** has added to its equipment boilers, new machine shop, 40 miners' houses, 200 mine cars, and 50 new 30-ton railway cars.

The mine of the **Mabou & Gulf Coal Company, Limited**, was put out of commission on August 8th. The Government of Nova Scotia is now keeping the mine in safe condition.

Improvements made at the collieries of the **Port Hood-Richmond Railway & Coal Company** have been noted before in these columns. Here the output has been brought up to 99,700 tons, an increase of 23,617 tons over last year. Safety lamps are in use, 300 Ackroyd & Best lamps being in stock.

### Cumberland County.

**Cumberland Coal & Railway Company's** Springhill collieries have had a good season. On No. 2 seam 1,800 feet of railroad and other pillars have been extracted at the 2,400-foot level to the rise. On other levels extensive work has been completed. On October 2nd the bench coal of No. 1 was struck. It was found to be more than four feet thick, of good quality, and free from stone and splint. Amongst other improvements, a new pumphouse has been erected level with the dams, and a Blake pump installed.

**Minudie Mine, River Hebert**, has worked continuously.

**Scotia Mine, Maccan**, was taken over by the Great Northern Coal Company of New York, on March 16,

In the "Deposits" column are entered the deposits made in the bank, and on the credit side is entered in the cash column the amount of cash deposited. In the "Discount" column on the Dr. side are entered discounts allowed to customers on the payment of their accounts. In the "Discount" column on the credit side are entered discounts received from creditors when paying to them the amount of their bill. In the "Cheques" column are entered all cheques issued against our bank account. At the end of each month the cash balance is posted to the debit of the cash account in the Ledger, and the bank balance to the credit of the bank account in the Ledger. The total of the discounts allowed is posted to the debit of discounts account, and the total of discounts received to the credit of discounts account. Opposite each entry in the Cash Book is the name of the other account affected by the transaction. If on the Dr. side the amount is posted to the credit of the account named. If on the Cr. side, the amount is posted to the debit of the account named.

To relieve the Cash Book from a mass of small items a Petty Cash Book is kept, a summary being made at the end of the month, and entered in the Cash Book in one entry. Many systems of keeping the Petty Cash are in use, but the following is perhaps the neatest and best: A cheque of say \$100.00 is given to the Petty Cashier, and then a cheque is given for the total amount of vouchers turned over to the Head Cashier, restoring the Petty Cash balance to the original figure. At all times the Petty Cashier must have on hand \$100.00 in cash or receipted vouchers. This system is called the Imprest System.

We will take up in the next paper the best forms for the Purchase Journal and Sales Journal as applied to mining. The foregoing discussion enunciates a few general principles of bookkeeping applicable to every form of undertaking, and it does not lose in value, because it does not bear solely on the mining industry. In the Purchase Journal, etc., important differences arise when they are applied to different lines of business. Therefore, while of no more value to the reader, the following article will be of more direct interest than the above.

## THE ELECTRO-METALLURGY OF IRON AND STEEL.

Abstract of a Lecture Delivered by Dr. Stansfield at McGill University Before the Members of the Canadian Mining Institute, 3rd March, 1909.

Dr. Stansfield's lecture, which was graphically illustrated by lantern views and experiments, was a terse and lucid sketch, tracing the main features in the development of the electric furnace with special reference to the electro-metallurgy of iron and steel. The following inventions were referred to as some of the principal steps in the first stage of this development.

1. **Acheson's Graphite Furnace** (1896), in which heat is generated by passing an electric current through a continuous carbon core for the purpose of converting anthracite into graphite. Though this furnace is a later invention for a special purpose, it illustrates the first principle of generating heat by the interposition of a solid resisting medium. This was practically demonstrated by passing a heavy current through a

stick of carbon, which was thereby heated to a white heat.

2. **Sieman's Electric Furnace** (about 1880). In this the charge is placed in a crucible between the opposing ends of two vertical electrodes the upper carbon and the lower metal fitted into the back of the crucible. This was the first application of any importance of the electric arc for heat production. Some copper was actually fused by this means before the audience.

3. **Moissan's Furnace**. A modification of the above principle, in which the arc, between two horizontal opposing carbon electrodes, is deflected down onto the charge immediately below it by means of an electromagnet placed beneath the furnace. By means of a most ingenious contrivance, invented by the lecturer some years ago for Roberts-Austen, the actual details of melting first copper and then iron by this process were reflected onto a screen much enlarged for inspection, forming a very neat, interesting and beautiful experiment.

To this point the furnaces had no special reference to iron or steel. Before proceeding to this stage in the development it was pointed out that while the cost of electric heat was very high (1 ton of good coal produces as much heat as 1.1-3 h.p. of electric energy per year), on the other hand the heat could be applied to the work in hand with far greater efficiency. In the electric furnace for every unit of heat used effectively about .5 unit is lost, in shaft furnaces the corresponding loss is about 1.6, in open hearth 3.1, reverberatory 7.5, and in crucible steel furnaces the enormous proportion of about 40 units is wasted.

The Canadian Government in 1903, recognizing the great importance to the Dominion of developing the smelting of iron ores electrically, appointed a commission, under Dr. Haanel, to investigate and report. Dr. Haanel, after visiting Europe, conducted some experiments at Sault Ste. Marie. These, together with investigations made by the lecturer and others, have demonstrated that, as compared with the usual methods of smelting and refining, electric furnaces (1) removed more of the sulphur and phosphorus, thus either giving a better quality of metal or enabling ores containing larger proportions of these impurities to be utilized, (2) could successfully heat ores containing a far higher percentage of titanium, (3) gave a denser and more homogeneous steel than even the crucible steel furnace.

The lecturer then proceeded to trace the steps in the next stage of the development, which has special reference to the production of iron and steel.

### A.—The Smelting of Iron Ores.

1. **The Heroult Furnace**. This, as used by Dr. Haanel for experiments at Sault Ste. Marie, consists essentially of a shaft, in which a vertical carbon electrode is suspended. The base of the furnace is lined with carbon, which forms the lower electrode. The length of the upper electrode limits the height of the shaft.

2. **The Turnbull-Heroult Furnace**. In this the shaft is higher, and the ore is conveyed at its base by inclined shoots to a smelting trough or canal, into which descend six electrodes, permitting the use of a three-phase current.

3. A Swedish modification, in which the gases from the top of the furnaces are conducted down to tuyeres placed on a level with the carbon electrodes, thus cool-

ing the latter and helping in the more rapid reduction of the ore.

### B.—STEEL FURNACES.

The chief processes used in the production and refining of steel are: (1) The open hearth, (2) the Bessemer, (3) the crucible process. It is only with the last of these that the electric furnace seriously competes, as its function at present is chiefly, as pointed out above, to produce the highest grades of steel, and not, as in the case of the first two processes, to produce large quantities of the lower grades cheaply.

1. **The Heroult Steel Furnace.** This has a shallow-hearth lined with dolomite. Two carbon electrodes descend through the roof nearly to the surface of the slag. An alternating current passes down one electrode through the molten metal and up the other electrode, thus forming two electric arcs.

2. **The Colby** is a simple induction furnace, consisting of a soft iron core, surrounded by an insulated primary winding, sometimes made of copper tubing, through which water is circulated for cooling purposes. In place of the secondary winding is an annular trough, which contains the metal, kept molten by the induced current.

These two furnaces were shown after the lecture in actual operation in the College Laboratory.

3. The next modification was practically a combination of two Colby furnaces, each with its iron core and primary winding belt so arranged that the annular troughs met in a central large chamber, thereby much increasing the capacity of the furnace. Additional iron pole-pieces, placed opposite this central chamber, served to give the additional heat needed at this point. The current being supplied to the pole-pieces from special secondary windings on the iron cores.

4. The latest improvement has been to substitute three-phase current for the two-phase, there being three iron cores, each with its primary winding and annular trough, connecting with the large central chamber. Pole-pieces are inserted between each pair of units. This furnace has been made to hold up to 8 tons of steel, and has the additional advantage of inducing a circulation in the molten metal, insuring more complete homogeneity.

Dr. Stansfield has recently written a book on "The Electric Furnace: Its Evolution, Theory and Practice," which those requiring more detailed information should consult.

D. B. LANGFORD.

## ELECTRICITY IN MINES.

By T. J. McKavanagh, Electrician, Cable SS. "Minia," Halifax, N.S.

Paper read before the Mining Society of Nova Scotia.

It is impossible in a paper of moderate length to go fully into comparative costs and economies; and I must be content with a review of what is generally accepted as the most modern and economical in the application of electricity to mining.

**Generating.**—Water power appeals most to those engaged in mining other than coal mining, and when within reasonable distance, and construction costs are moderate, is the most economical prime-mover. Occasionally a low priced steam plant is less costly than storage works to take care of the load peak in dry seasons; and there is ample evidence of considerable economy being affected by the use of steam in water-power schemes. Steam turbines of both the velocity and impulse types are superior to the reciprocating engine; the advantages being briefly low capital and running costs, small space occupied, light foundations, and in the matter of steam consumption, the low pressures admissible make easy the use of high superheat. Gas engines, favorably located, are slightly more economical than turbines at high load factor, but the turbine excels at the low load factor usually obtained in mining.

**Distribution.**—The mechanical simplicity of the induction motor, and convenience and economy in transmission, have brought the three-phase system into almost universal use. Underground safety, convenience and economy, in order given, must be satisfied and when reasonable care is exercised electricity is eminently satisfactory. Economy must not be lost sight of in our striving for safety; and an inexpensive cable, well installed, will serve better than an expensive cable in which the maker is supposed to have said the last word regarding safety.

Bitumen-insulated cables, lead covered and wire armoured, laid solid with bitumen, in wood or metal troughing, is common practice. The copper cores of such cables are liable to become decentralized when

carrying full load for long periods; and the wooden bridges and inferior bitumen filling often used are decidedly injurious to the lead cover and wire armour. Asphalt bridges and clarified bitumen are proper. Cheap and reliable is paper insulated bitumen sheathed cable laid solid in a mixture of good pitch and pitch-oil in wood or metal troughing.

Armoured cables carried in slings are much benefited by occasional applications of bitumastic paint, and when the protective materials are well compounded, may be laid direct in ground or, better still, in a trench of puddled clay.

The desirability or otherwise of "grounding" the armour of cables has often been dealt with, and we are certain that "grounding" in practice does not afford protection against shocks. This is not because of "grounding," but owing to the great difficulty in the way of providing reliable "grounding," and in the sense of security felt in some "grounds" which are liable to become seriously affected by changes in the strata. "Grounding" of the armour is the immediate cause of many types of bad faults, and owing to the great uncertainty of "grounds" in dry mines, danger from shocks is perhaps best guarded against by using no "ground."

Fully ninety per cent. of the faults in direct current systems can be obviated by using concentric cables in which the inner wire is negative. Cables bunched together should be suitably protected to prevent flame spreading in the event of a cable breaking down. Asbestos strips about three inches wide, and three-sixteenth inch thick, soaked in a solution of silicate of soda and wrapped on the cable while soft, afford excellent protection.

Three-phase cables (6,600 volts), paper insulated, lead covered and double wire armoured, are in a recent installation carried down shaft by means of wooden cleats bolted to channel irons let into wall. The same

type of cable is in another instance carried down shaft a pitch-pine casing. The casing has a groove slightly less than the diameter of the cable, and the cable is jammed home and a pitch-pine cover screwed on. Mechanically this method to take weight of cable is good, and the necessity for armoring is evident; but the fire risk is greater than in the former method; and an overloaded cable would more readily break down owing to the heat insulating properties of the wood.

**Switches and Motors.**—Switches must be gas-tight, and when not of the oil-brake type, should be flame-tight if placed where not in the path of downcast air current. Excepting oil-break switches, no switch is proof against the lighter gases, and when not favorably placed they must be able to withstand the shock of internal explosion, and by means of wide joint faces, cool the escaping gases to make external ignition impossible. A switch much used in surface work, having two blades hinged at one end and held together at the other end by a bar of insulating material carrying a handle and metal stubs and screws, has recently been condemned. An operator opening a motor switch received fatal shock through his little finger touching one of the screws. The current was alternating 250 volts. At least four healthy persons received fatal shocks from 200 volts alternating current system during 1907. Six thousand volt cables are safe.

Direct-current motors with interpoles and fixed brushes, at all loads are sparkless, and indeed excellent; but cannot equal the performance of induction motors which have worked without harm when submerged. Tests on flame-proof motors have proved them worthy of the name; but at coal-faces where gas-blowers are frequent and ventilation difficult, compressed air presents fewer risks and should be used.

**Applications.**—The electric motors have considerably influenced the design of mining pumps, and the centrifugal pump direct driven by an induction motor has no peer in mechanical and low first cost. Owing to the perfect balancing in turbine pumps, and the constant turning effort of the electric motor, heavy foundations are not required for this type, and the small space required is often a considerable advantage. It cannot now be objected that the centrifugal pump is confined to low heads: a head of 1,650 feet has been overcome by two inter-connected electrically driven pumps handling 1,540 gallons per minute.

At Lindall Moor mines, three stage vertical sinking pumps direct-coupled to 315 b. h.p., 3,000 volt motors, and running at 1,480 r.p.m., handle 1,000 gallons per minute against total head of 780 ft. Combined efficiency of motor and pump seventy-three per cent. Some makers claim eighty-five per cent. as combined efficiency of direct-driven pumps.

Vertical type motors, direct-coupled to centrifugal pumps, and the pumped water taken round the motor case for cooling purposes, are being successfully used.

**Drills.**—Electric percussion drills operated by solenoids, taking current from a low frequency two-phase generator, or operated by motor placed on top of drill chamber, are well taken up despite much adverse criticism by air-drill makers and users.

A novel combination of motor, compressor and drill, lately introduced, has many good points, and a large number of complete outfits are in successful operation. The compressor is a valveless, duplex, single-acting machine, and two short lengths of hose convey alternate impulses of air pressed to about 40 lbs., to a special type of air-drill. There is no exhaust, and the air car-

ries atomized oil which lubricates the drill compressor pistons. A 5 h.p. motor-compressor equipment is equivalent to a  $3\frac{1}{4}$  inch air-drill working at 100 lbs. pressure.

The motor and compressor are mounted on a small trolley suitable for mining gauges, and the alternate current motor equipment weighs 730 lbs. with 60-cycle motor, and 820 lbs., with 30-cycle motor, and the direct current motor equipment weighs 883 lbs. Drill weight, 288 lbs.

**Coal-cutters.**—Electrically driven coal-cutters make satisfactory progress, and when compressed air is used with coal cutters, considerable economy can be effected by the use of electrically driven portable air compressors, owing to the short pipe lines and smaller compressors, impossible when steam is used. A motor compressor having 4 cylinders disposed radially in a circular cast-iron casing, and capable of dealing with 120 cubic feet of free air per minute, and delivering at 80 lbs. per square inch, has a base 3 ft. by 2 ft. 6 in. extreme width at end of motor bearing 4 ft. 9 in. and height of 4 ft. 6 in.

**Ventilation.**—Fan driving is now entrusted to the electric motor, and at Durham Colliery a 55 inch double-inlet service fan, with a capacity of 145,000 cu. ft. per minute against  $2\frac{1}{2}$  inch water gauge, is driven by a 2 speed induction motor of 62.5 and 125 b. h. p. running at 183 or 365 r. p. m. as required.

**Haulage.**—Main and portable haulages are most economically and conveniently operated by electricity; and where conditions permit of its use, the electric locomotive is rapidly displacing the mule and compressed air locomotive. In coal gathering from the face, the electric locomotive is particularly useful and economical; and perhaps there is room for the storage battery locomotive in this class of work. Storage battery locomotives with flameproof motors and oil type switches are not burdened with overhead wires, rail return and sparking trolley, and should find favour where sparking is objectionable. Electrically driven conveyors carrying coal from the face to the gate, are extensively used, and great saving is claimed for them when working thin seams.

**Winding.**—While it is admitted that the modern steam winding engines are excellent, and that in winding, electricity has a formidable rival; nevertheless, electric winding is the more economical, and decidedly so, when working deep mines or where it is possible to supply a number of mines from a generating centre. Several systems have been tested in every-day working on the continent, and we now have sufficient information as to their merits and demerits, and their economy as compared with steam.

We will now deal with a system which has proved satisfactory, and the best of its class, and figures from a representative installation will give an idea as to the sizes of the machines for a given duty. A Koepe pulley having a diameter of nearly 10 ft. is used, and the haulage speed is 33 ft. when motor makes 64 r. p. m. Hoists 492 tons in eight hours from depth of 2,625 ft. Current at 1,000 volts, 44 cycles per second, is supplied to a 250 h.p. 3-phase motor. Directly coupled to this motor is a direct-current generator of 650 k.w. capacity at 500 volts, when running at 285 r. p. m. On the same shaft, between the motor and generator, is a fly-wheel of cast steel, 13 ft. in diameter, and weighing about 40 tons.

The winding motor is a separately excited, direct-current machine, rated at 320 h.p., 64 r. p. m., and taking current at 500 volts from the direct-current generator of the flywheel set. It is able to take an overload of 45% for 30 minutes, and 100% for five minutes.

The working of the system is briefly thus: The flywheel-set being running, exciting current is applied in progressive steps to the fields of the generator and haulage-motor, thereby causing the voltage of the generator, and the speed of the motor, to increase progressively.

At this, the accelerating period, the haulage-motor demands about 615 h.p., but no abnormal demand is felt at the generating station; the kinetic energy of the flywheel supplementing the induction-motor and enabling the generator to give up the required energy. The power required at full speed is very small, and the power supplied by the induction-motor is absorbed by the flywheel in regaining its normal speed, reduced when the heavy load came on. The power-demand on the generating station is practically uniform, and is only the normal rating of the induction-motor.

While stopping, the exciting current of the generator field is interrupted, and that of the motor increased. The counter emf. of the motor, now driven by the inertia of the moving masses, greatly exceeds the emf. of the generator, and the motor gives back current to the system and at the same time acts as a brake, giving smooth and quick retardation. While winding, should the 3-phase supply be interrupted, the inertia of the flywheel is sufficient to ensure winding for some considerable time.

The speed variations of the flywheel-set lie between 490 and 432 r. p. m. In a series of tests of this system, a winding-drum of 12 ft. diameter and weight of 16 tons, direct-coupled to a motor running at 150 r. p. m., was used (the ropes being removed), and it was found possible to change from full-speed in one direction to full-speed in the opposite direction in  $3\frac{1}{2}$  to 5 seconds.

A system but recently brought to notice bids fair to supplant the former system, and without doubt its operation is very simple and economical. It is known as the Thury direct current series system, and while it may or may not have been applied to winding, its suitability is evident, and the successful operation of the generators and motors involved is beyond doubt. Here we have a direct series generator in the generator station, and further, the generator-shaft carries the flywheel.

A direct-current series motor is coupled to the winding-drum, and starting, stopping, reversing and breaking are all easily controlled by one lever that directly, or through gearing, shifts the brushes on the motor. No switches or rheostats are required in the motor-room, and the generator-switchboard surprises one used to 3-phase switchboards. In fact, switchboards are not required; a pedestal carrying a double-pole switch, ammeter, and voltmeter, being sufficient.

Excepting for stops of considerable duration, the brake need never be applied; the single control-lever puts brushes in neutral position, and the motor is held at rest for any length of time, provided generator is running. The speed of winding can be fixed at certain predetermined limits by aid of a centrifugal governor, acting directly on the brushes, and suitable devices ensure smooth retardation and prevent overwinding.

As in the former system, the flywheel is called upon to assist at acceleration periods; but here the generator must be capable of standing overloads, and the prime-

mover need only be large enough to cope with the mean load. The factor of this system is large. There are no fuses, no circuit-breakers, no small wires, and no multiplicity of small exciting and switch motors, and accident to the prime-mover will not result in immediate shutting down of the system. With sufficient flywheel effect and prime-movers aggregating 1,000-1,200 h.p. winders absorbing 9,000 to 12,000 h.p. can be satisfactorily operated.

Long-distance, high-tension transmission systems delivering current at 60,000 volts to series motors coupled to 3-phase alternators, are being operated successfully, and this is the system of transmission to be used in the Victoria Falls scheme.

### UTILIZATION OF SCRAP TIN.

Outside of the direct production of tin from the ore there is in Europe, and especially in Germany, a great quantity of tin regained from scrap tinned sheet. The amount of scrap tin thus treated in Germany is about 30,000 tons a year. This is mostly done by electrolytic processes, the coated tinned iron or steel being placed in an iron basket, which is used as the anode of a powerful electric current, and plunged in an 8 to 10 % solution of soda lye. The tin is deposited in a spongy form on the cathode; the resulting mass is washed, compressed and melted. As the scraps as a rule have on them only about 2 to 3% of their weight in tin, we can put the amount of pure metal thus gained at about 600 to 900 tons per year. The most important works of this kind are in Essen, on the Ruhr—principally famous as being the seat of the Krupp parent establishment.

R. G.

### DESCRIPTION OF SAFETY CATCH IN USE AT N. S. S. & C. CO., SYDNEY NO. 1. COLLIERY.

(From the Report of the Nova Scotia Department of Mines.)

Fig. 1 shows the general arrangement of auxiliary safety catches used in connection with the coal cage. They are known as Walker's detaching hooks. The hook failing to hold the cage in case of an overwind, it is the intention that the cage will drop back and be caught at four points by the catches marked A. Two of these engage, at each end of the cage, the top band of the cage. The handspring T keeps an inward tension on these catches within limits that may be adjusted by the stop marked S, arranged so that the cage is always free to be drawn in an upward direction through the catches; but once having passed through, the close together and prevent the cage from coming back.

Fig. 2 shows safety doors used in connection with the Walker hooks on man shaft No. 1 colliery. The doors are placed about four feet below the bottom of the cage, when the Walker hook has engaged the hawse pipe.

The doors are built of 3-inch hardwood, completely covered on the bottom and around the edges with steel plate, forming a smooth surface with the tackling chain of the cage to work against. In the event of an overwind, these doors are forced open by the chain and cage passing through, and are closed by means of a spring. This design can be used only where centre spears and buntons are used.

Fig. 3  
with the  
fight for  
on in the  
about thr  
between

Fig. 3 shows the safety catches used in connection with the Walker hooks on coal shaft at No. 1 colliery. Eight forged steel-patches are placed in a vertical position in the centre of each end of the cage and spaced about three feet apart, vertically. They are supported between two 4 by 6 by 3/4 inch angle irons fastened in

a number of places to the head frame. The catches are steel forgings hung by the pin, and are prevented from turning over the centre by means of a rivet marked C, and take the weight off the cage by means of stopper B.

JOHN PRESTON.

**THE SLICKENSIDES LETTERS.**

Cobalt, Ont., Oct. 20th, 1908.

Mr. Geizhals, Toronto:

Dear Sir,—According to instructions, I examined your claim on the Boomflats, and report as follows: I reached your claim after a perilous passage in a canoe and effected a debarkation. I found that there were some unusual geological features presented, and therefore considered it advisable to return and secure the services of the eminent foreign expert and scientist, Mr. Lugenpeter. I was fortunate enough to find Mr. Lugenpeter free for a few days, and he returned with me at once to the claim. I am indebted to him for the scientific portion of the report. The practical suggestions are my own. Mr. Lugenpeter, however, authorizes me to state that he fully concurs in them.

We found that the claim consisted mainly of rock, which the local expert called "awful fine diabase," but Mr. Lugenpeter did not have such a high opinion of it, as he explained the acid edge was lacking, and, in fact, the basic properties predominated. He therefore did not consider the chances so good.

I would advise you to refer to Mr. Obalski's paper entitled "La Probabilite de trouver des Mines."\* The whole theory of prospecting is embraced in this, and it is expensive to acquire the same knowledge practically. Mr. Lugenpeter, although urged, would not state definitely what the "Probabilite" was in your case. The rocks, which Mr. Lugenpeter pronounced a "metamorphosed gabbro with phenocrysts of amphibole," contained a number of cracks or seams, which were filled mainly with mud. The local expert pointed out some calcite of a fine quality, but we were unable to see any silver. It was an off day for silver evidently.

The workings consisted of a hole or incipient shaft about 10 feet deep. This would be dangerous for rabbits, but otherwise will not do any harm, provided it is not extended any farther vertically. I would suggest that you have some poultry netting put round the shaft to keep things from falling in. There is nothing in the shaft now, and it would be a pity to see anything go into the hole.

Mr. Lugenpeter would not accept any direct remuneration for his services, except the actual expenses. He is, however, profoundly interested in the establishment of a fund to found an institution to teach prospecting solely. He leaves the amount of the fee you will pay to this fund entirely to yourself. No doubt the sum you decide on will be in keeping with the highly illuminative and valuable opinions quoted above. As soon as the fund has accumulated sufficiently, the institution to teach La Probabilite de Trouver des Mines au nord de la Province d'Ontario will be founded. I remain,

Yours faithfully,

J. M. SLICKENSIDES.

\*Paper read at the Quebec meeting of the Canadian Mining Institute, 1906.

Toronto, November 15th, 1909.

Mr. Geizhals, Toronto.

Dear Sir,—Subsequent to the date of my report of October 20th, Mr. Lugenpeter communicated with the well-known authority, Dr. Bartyrllowell, whose abstruse writings on the aplitic phase of the diabase have excited so much interest among prospectors. Mr. Lugen-

peter, with the true modesty of science, was quite willing to concede Dr. Bartyrllowell a place among scientists fully equal to his own. He considered that every respect Dr. Bartyrllowell was entitled to render with him.

Dr. Bartyrllowell fully concurred with Mr. Lugenpeter in the opinions expressed above. I consider therefore, that this settles the matter entirely, and there is no doubt about the report being correct and final and conclusive in every respect.

Yours truly, J. M. SLICKENSIDES.

**BOOK REVIEWS.**

**Clays, Their Occurrence, Properties, and Uses. With Especial Reference to those of the United States. By Heinrich Ries, Ph.D., Professor of Economic Geology in Cornell University.**

**Second Edition Revised—8 vo, xix+554 pages, 11 figures, 44 plates. Cloth, \$5.00 (21 shillings, net) John Wiley & Sons, New York. Chapman & Hall Limited, New York. 1908.**

Whilst Dr. Ries' object is to treat his subject particularly from an American (United States) point of view, more than half of his volume is composed of information that is of general application. In the first four chapters, comprising 311 pages, the following topics are discussed:—Origin of Clay, Chemical Properties of Clay, Physical Properties of Clay, Kinds of Clays, Methods of Mining and Manufacture. The remainder of the book is taken up with a detailed account of the distribution of clay in the United States, including many chemical analyses and useful geological observations.

The former chapters are, therefore, the more important to the Canadian reader.

In Chapter I. is given a careful elaboration of the origin of clay, the weathering processes involved, kaolinization, residual clay, kaolin, mechanical changes, chemical changes, consolidation, concretions, and other kindred phases in the formation and history of clay deposits. It is impossible here to note many of the features of this chapter. Dr. Ries' classification of clays, however, is worthy of special attention. The following are the main heads of his scheme:—

- A. Residual Clays. (By decomposition of rocks *in situ*.)
- B. Colluvial Clays, representing deposits formed by wash from the foregoing and of either refractory or non-refractory character.
- C. Transported Clays—
  1. Deposited in water.
  2. Glacial clays.
  3. Wind-formed deposits.
  4. Chemical deposits.

Dr. Ries' gives this classification in much more detailed form than the above. His scheme is, we believe, the most satisfactory and least arbitrary one that has yet been offered.

Chapter II., entitled "The Chemical Properties of Clay," is an excellent resume of functions and importance of the essential and incidental constituents of clay. The interpretation of ultimate chemical analyses is thoroughly discussed. Rational analyses, which have for their object the determination of the percentage

the different mineral compounds present, are explained; and the two methods are correlated. For both methods the laboratory routine is given. The effect of each mineral constituent upon the process of manufacture and upon the finished article is carefully explained.

"Physical Properties of Clay" is the title of Chapter III. Here such qualities as plasticity, texture, tensile strength, fusibility are defined and discussed. In both Chapters II. and III. the bearing of chemical and physical investigation upon the commercial value of clay is constantly kept before the reader.

Chapter IV. defines the different varieties of commercially valuable clays, and describes methods of mining and manufacture.

The remaining chapters deal with the geology and distribution of the clay deposits of the United States. Many of these deposits are, of course, closely related to neighbouring Canadian occurrences.

Dr. Ries has carried into his work a large and compelling enthusiasm. Whilst his capacity for minute and painstaking observation is obvious, it is also clear that he has grasped the economic philosophy of his subject. Hence his book is unquestionably profitable to all those who seek a wider knowledge of the possibilities of the clay industry, an industry that should presently attain large proportions in Canada.

#### PERSONAL AND GENERAL.

Mr. O. B. Smith, superintendent of the Granby mine, has gone on an extended trip to California.

Mr. R. B. Watson, general manager of the Nipissing Mines Co., was in New York recently on company business.

Dr. J. E. Woodman, of Dalhousie University, Halifax, has been appointed professor of geology in the University of New York.

Mr. E. E. Musgrave, general agent for the Tyee Copper Co., of Ladysmith, B.C., is in Mexico arranging for purchases of ore for shipment to the Tyee smelter.

Mr. A. J. McMillan, managing director of the Le Roi, has returned from London, England, where he attended the recent annual meeting of the Le Roi Mining Co.

Mr. W. A. Carlyle, consulting engineer of the Le Roi, is leaving for England to confer with the directors regarding the proposed exploration and development of the mine.

Mr. A. B. W. Hodges, general superintendent of the Granby Company, has been on an extended trip to Arizona and Mexico, where he inspected several of the large smelting plants.

Mr. Walpole Roland, consulting mining engineer, Port Arthur, Ont., who met with a serious accident about two months ago while engaged in professional work, is nearly recovered from his injuries.

Mr. A. B. W. Hodges, general superintendent of the Granby Company, and Mr. R. H. Stewart, manager of the mines of the Consolidated Mining and Smelting Co., have been interviewing the B. C. Government regarding some changes to be made in the code of mine signals now in use.

The following gentlemen were elected to membership at the regular March meeting of Council, held on the 2nd instant:—

Members—J. Austen Bancroft, McGill University, Montreal, Que.; J. L. Coulson, M.E., 186 Beverley

Street, Toronto, Ont.; James M. Macoun, Geological Survey, Ottawa, Ont.; James McGregor, Inspector of Mines, Box 668, Nelson, B.C.; Armand Mosco Vici, Box 544, Montreal, Que.; Horace G. Nichols, M.E., Ymir, B.C. Prof. Wm. Nichol, Queen's University, Kingston, Ont.; Sydney Smith, General Manager Duchess Silver Mining Co., Cobalt, Ont. formerly associate member); R. B. Watson, M.E., care Nipissing Mining Co., Cobalt, Ont.; R. P. D. Graham, Montreal, Que.

Associates—A. W. English, Giroux Lake, Ont.; M. Gallagher, Standard Explosives, Ltd., 132 Board of Trade Building, Montreal, Que.; Alfred McMillan, Rossland, B.C.; Chas. A. Smart, 33 Sussex Avenue, Montreal, Que.

#### CORRESPONDENCE.

To the Editor Canadian Mining Journal:

Dear Sir,—I read with interest your editorial comment on Mr. Corkill's report for the Ontario Bureau of Mines, in which special reference was made to the undue prevalence of accidents in the Cobalt district. The question of the accident rate in mines is one of such wide importance, from the humane as well as the economic point of view, that on exchange of data and experiences between various mining fields may prove of service, even when the conditions obtaining may appear fundamentally dissimilar. Upon the Rand gold fields, which employ 185,000 men, 700 to 800 annually lose their lives through mining accidents. This high rate of 4 per 1,000 is largely due to the great number of native labourers employed. The advantage of placing men of good technical qualifications even in the lesser positions of control has been evinced during the last year or two by a remarkable advance in underground efficiency and decrease in costs. But the change, the application of engineering principles and other organization where all was previously under the careless direction of the rule-of-thumb man, has also had its marked effect on the accident rate. The figures for 1907 and 1908 (the latter year essentially one of high pressure work) compare as follows:—

| Men Killed Owing to—      | 1907. | 1908. |
|---------------------------|-------|-------|
| Fall of ground.....       | 197   | 204   |
| Explosives . . . . .      | 280   | 209   |
| Other accidents . . . . . | 333   | 299   |
|                           | 810   | 712   |

There was thus a decrease of 100 in the fatalities in 1908, although there were 10,000 more men employed. The influence of the more capable and scientific supervision is further indicated by the large decrease of accidents due to explosives, which class of mishap is above all others attributable to carelessness or inefficiency.

The current half year is unfortunately destined to show an unfavourable record owing to the flooding disaster at the Witwatersrand mine, by which 125 men lost their lives. But it is most probable that the rate will show a steady decrease in future under the better systems of supervision being gradually established.

Yours faithfully,

RALPH STOKES.

Eckstein's Central Administration, Johannesburg S.A., Feb. 20th, 1909.

Bridgewater, N.S., March 8, 1909.

Editor of The Canadian Mining Journal, Toronto.

Dear Sir,—In answer to the questions of Mr. J. D. Ramsay in your issue of March 1st, I beg to reply as follows:—

I stated that I objected to the conclusion of Prof. Haultain that free-milling gold ores in general could be valued more accurately by assaying than by mill-test.

I also stated that in my remarks I referred particularly to the free-milling gold ores of Nova Scotia.

I am not familiar with the Rand ores; but I can hardly believe that even with them an assay is more accurate than a mill-test, provided, of course, that the samples for both are taken with the same degree of accuracy. I may say that my sampling has been done carefully and systematically in all cases.

Of course, the gold is unevenly distributed through the veins. There are very few free-milling gold ores in the world where the gold is not so distributed.

Yours truly, E. PERCY BROWN.

### IMPRESSIONS OF COBALT.

To the Editor of the Canadian Mining Journal:

In the "London Mining Journal" of February 6th "an occasional correspondent" has an article under the above heading, his second impressions after a two weeks' stay in the camp. Naturally, after so short a visit, especially in the winter when the snow lies heavily on the ground, a man is more than likely to get certain false impressions.

He says in speaking of the Keewatin: "This formation, then, is far from hopeless, as was at one time imagined; certain veins in passing into the Keewatin from conglomerate or diabase have at first suffered impoverishment, but on further exploration have regained their valuable contents." This correspondent has been misinformed. The Keewatin was never

thought to be hopeless. From the early days of the camp certain productive veins have been known to occur in the Keewatin. The correspondent is quoting others, rather than recording his own observations, when he says that certain veins which have suffered impoverishment on passing into the Keewatin, from conglomerate or diabase, have again regained their valuable contents. To quote again from the article: "In the central portion—notably in the O'Brien and Nipissing—there does not seem to be any favor evidenced for either conglomerate, diabase, or Keewatin; farther east it is reported the Drummond mine in passing from diabase to Keewatin changed for the worse, whilst the Nova Scotia had a direct reversal, being greatly benefited." While the O'Brien has good veins in both the conglomerate and diabase, it may be asked what percentage of the output has come from the Keewatin? The Nipissing has had one good vein in the Keewatin but the great majority of their numerous veins have been in the conglomerate. The Drummond vein was in conglomerate, and not in diabase. The Nova Scotia vein is in Keewatin at the surface, and passes downwards into a diabase sill.

The article has the following sentence: "Personally, from what I have recently seen, I should consider the Montreal River section quite equal to duplicating the present output of the Cobalt section." Mining men are frequently accused of being optimists; this correspondent is certainly one. Whatever may be the future of the Montreal River section, there is nothing to lead one at present to say that it will duplicate Cobalt in silver production.

Doubtless the correspondent has intended in his article to give readers of the "London Mining Journal" a fair and unbiased account of the Cobalt camp from impressions which he has gathered. The article is simply an illustration of the kind of stuff with which the public is fed during a mining boom.

Yours, etc.,

READER.

## INDUSTRIAL PAGE.

### AN INDUSTRY WITH TRADITIONS BEHIND IT.

The B. Greening Wire Company, Limited, Hamilton, Ont., has issued a large illustrated catalogue. In a prefatory historical note much matter of interest is given. Very rarely in this country can the family history of the heads of an enterprise be traced back for several centuries. The Greening family, however, since the year 1600, has been connected with the wire and allied industries.

It is on record that about 1600 A.D., at Tintern Abbey on the Wye, pins and needles were manufactured by a member of the Greening family. In the year 1799 Nathaniel Greening, at the age of 20, went to Warrington from the Tintern Abbey wire mills, and there established a business in wire drawing on Bridge Street, near the site of the present Lion Hotel. A few years later the firm of Greening & Rylands was formed. This concern lasted until 1840, when the partnership was dissolved. Mr. Greening then took his sons into business under the firm name of N. Greening & Sons.

The late Benjamin Greening, second son of Nathaniel Greening, had served a seven years' apprenticeship with Greening & Rylands as a wire drawer. On the

completion of his apprenticeship he commenced business for himself, and continued until 1858. He then removed to Canada, and became one of the pioneers of the industry here. Under the firm name of B. Greening & Co. he carried on the enterprise successfully until his death in 1877. His son, S. O. Greening, succeeded him and added largely to the works. In 1889 the B. Greening Wire Co., Limited, was incorporated as a joint stock company. Since that time important additions have been made annually to the plant and equipment. In 1907 very extensive additions were made, including an entirely new weaving mill and plant of the finest description.

The Greening catalogue contains detailed descriptions of the various grades and kinds of wire cloth for screening, milling, bolting, fanning mill use, etc., etc. Perforated metals, brass and copper wire cloth, window guards, steel wire chains, and numerous other articles are listed, with full specifications, in the catalogue. Mining men will find the pamphlet useful in their offices.

### THE HENNIG ORE CONCENTRATOR.

Reference was made in the Canadian Mining Journal of March 15 to the Hennig concentrating table. Through the courtesy of the manufacturers, the Ore Dressing Machinery Co., 114-118 Liberty Street, New York, we are enabled herewith to reproduce several cuts that will illustrate the principles and working of the table.

The driving gear is in one piece, and includes fast

crosspieces made of 8-inch by 8-inch timber, and resting on these crosspieces are two 9-inch channel bars. The table proper rests upon the two crosspieces, the four corners of which are fitted with short steel pins that have ball ends. These pins work freely in sockets fitted to the ends of the crosspieces on the bottom of the table.

Fixed rigidly to the channel bars are the crosspieces, and projections from the crosspieces work freely be-

THE HENNIG CONCENTRATOR.

and loose pulleys, balance wheel and double eccentric drive. Three-quarter horsepower is required to drive the table. The longitudinal oscillations may be varied from nothing up to 15-16 inch. The rate of the oscillations range from 150 to 180 per minute.

The Hennig table is provided with a total length of 1,256 feet of riffles. Each riffle is made up of semi-circular metal strips. Each metal strip is 5-6 inch wide and 3-16 inch high, except when flattened. At the feed

tween guides attached to the bottom of the table. The guides may be set at any angle with the line of the driving rod, thus giving the required amount of side motion. From the ball-and-socket arrangement mentioned above a rocking motion may be imparted. Thus these three motions, longitudinal, side, and rocking, reproduce closely that of the orthodox prospector's pan.

The feed trough is 15 feet 7 inches long, 3 inches high, 8 inches wide at the feed end, and 3 inches wide

SUBSTRUCTURE AND DRIVE.

and of the table the distance between the riffles is 3 inches, while at the discharge end it is only  $\frac{3}{4}$  inch. These figures vary according to the requirements of the ore under requirement.

The riffles are flattened as the discharge end of the table is approached, and are arranged in sinuous curves.

The foundation of the table consists of three 5-foot

at the discharge end. Adjustable gatelike strips divide the trough into five compartments, leaving spaces anywhere from 1-10 inch to 5-16 inch. The pulp is fed onto the table through holes placed  $2\frac{1}{4}$  inches apart in the outer side of the feed trough. At the feed end of the table these holes are  $\frac{3}{4}$  inch in diameter. Those at the discharge end are only  $\frac{3}{8}$  inch. The feed trough is capable of adjustment to within 0.001 inch.

TABLE AND FEED TROUGH.

The ore is allowed to pass into the wide end of the trough at the head of the table. The gates being adjusted, a concentrating effect is obtained by the grooves in the bottom of the trough. With proper adjustment 90 per cent. of the concentrates should be made in the trough, only the balance of the pulp passing over the table. The curved riffle and the gyratory motion cause the pulp to be washed within the arc of every small curve continuously over the entire length of every riffle. The average capacity of the table is about 50 tons in 24 hours.

Messrs. Jones & Glassco, of Montreal, who have been introducing Renold chains into this country, have been meeting with splendid success. The J. R. Boot Paper Company have ordered four main drives from motors 75 horsepower each. This firm has already had a Renold chain running night and day for three years which shows no sign of wear. The Wire and Cable Company have ordered twelve of the drives, and several orders have been filled for single drives. The Bell Asbestos Mine has recently installed one of these drives to replace gears on a locomotive.

## SPECIAL CORRESPONDENCE

### NOVA SCOTIA.

**Free Coal.**—The new U. S. tariff provides for free entry of coal, with an "if," and as usual an important "if." Uncle Sam is given to making offers in the subjunctive mood. Canada should know that by this time. The following figures will bear study. In the twelve months of 1908 the Dominion of Canada produced 10,511,426 tons of coal. She consumed 20,714,821 tons, or twice as much coal as was mined in the Dominion. The deficiency between her coal output and consumption was made up from the coal fields of the United States. It is usually supposed that the bulk of the coal importations into Canada from the United States consist of anthracite coal, which cannot be produced in Canada, because we do not possess anthracite coal fields. This is a comfortable belief, but what are the facts? The coal imported into Canada from the United States amounted in 1908 to a total of 10,203,395 tons. Of this amount 7,084,130 tons, or approximately 70 per cent., was bituminous coal, while 3,119,265 tons, or 30 per cent. only was anthracite, and anthracite dust.

The coal mining industry of the Dominion has not made the strides it should have done. It has lagged behind the other mineral industries of Canada. In 1900 the total Canadian coal production was 5,777,319 tons. Last year, as previously mentioned, it reached 10,500,000, being an increase in nine years of four and three-quarter million tons. This figures out to an annual increase of half a million tons annually.

Compare this with the coal production of the United States. This has now reached the appalling total of five hundred million (500,000,000) tons per annum, and the output is increasing at the rate of fifty million (50,000,000) tons yearly. Compared with the coal mining industry of the United States, our Cana-

dian industry is very small beer indeed. But, small as it is, the coal mining industry yields one-fourth of the entire revenue that is obtained from the mineral output of the Dominion.

Will free coal tend to enlarge the growth of the coal mining industry? If under the fostering care of protective coal duties the industry has advanced by such insignificant increases in output, what will happen when the protection is removed and the barriers are let down?

It has become the fashion to believe that Canada is very poorly supplied with coal seams, and indeed it is rare to find anyone, outside of the limited circle of the men engaged in the coal industry, who has any true conception of what Canada possesses in the way of coal. It is quite true that from New Brunswick to Manitoba coal is not to be found, and that, as the recent Government Report puts it, "the coal fields of Canada are not found in proximity to the centres of population." Such a statement might be fairly modified if it read "not found in proximity to the present centres of population." Coal has a way of attracting population, and some day in Canada it will be far more correct to say that the coal fields "are in proximity to the large centres of population."

The report just referred to states that 60 per cent. of the Canadian output is produced in the Maritime Provinces, and 40 per cent. in the West. How long will it be before these figures are reversed? The report is accompanied by a map of the prairie provinces, Manitoba, Saskatchewan and Alberta, which the coal-bearing country is indicated by green coloring, and there is green enough to satisfy an Irishman on Patrick's morn. From the Peace River to Saskatoon, a distance of 600 miles, is one continuous stretch of coal-bearing land. quote from the Government's Report: "It is difficult to real-

the immense area underlaid by coal-bearing rocks in these provinces. Mr. Dowling, of the Geological Survey, has shown in a recently published map that there are four different coal horizons, all more or less productive, reaching from the summit of the Rockies to Manitoba between the international boundary and the Peace River."

New collieries are being opened up all the time in the Western coal field, and new coal companies in large numbers are seeking incorporation. Indeed, Western Canada seems on the eve of becoming one of the great coal-producing districts of the North American continent. In comparison to the vast coal deposits of Alberta and Saskatchewan the coal fields of the Maritime Provinces are small.

Free admission of American coal into Canada would spell ruin, absolute and irremediable ruin to Nova Scotia. How very dependable Nova Scotia is on her coal fields may be gathered from the fact that the idleness of one single colliery through fire was given as a partial excuse for a deficit in the provincial revenue in 1907. There is a coterie of mild lunatics in Nova Scotia who call themselves the "Free Coal League." At least one hears about this league occasionally, and therefore its existence is presumed, although some people say it is a one-man show. Letters from the league refer to the "incredible folly" of Canadians in refusing Uncle Sam's offer of reciprocity in coal. They claim that if the New England markets were open to Nova Scotian operators we should be shipping from this Province "16,000,000 per annum, instead of 600,000 as at present." The general argument of the reciprocity advocate is that New England is the natural market of Nova Scotia. Maybe, only New England is in the United States and Nova Scotia is in Canada. But aside from that, could Nova Scotian operators compete successfully with American operators even in New England? The United States coal trade papers say not, and they should know what they are talking about. "Mines and Minerals," in a very frank editorial, says in effect that free admission of U. S. coal into Canada would give to the American operators a large and profitable market, and at the same time the Nova Scotian coal operators could not successfully meet West Virginia coal in New England. If U. S. coal trade papers write in this strain, and if they see great advantage to themselves in a free coal arrangement, even for that particular territory which is claimed to be natural market of this province, how can that advantage be ours also? In vain is the net spread in the sight of any bird.

**U. M. W. A.**—On the application of two members of the U. M. W. of America, the Department of Labour has granted a Board of Conciliation to inquire into an alleged dispute between the Dominion Coal Company and its workmen. In their application the U. M. W. A. claim that the Coal Company has discriminated against members of the U. M. W. A., and has given preference to members of the Provincial Workmen's Association. That is about the gist of the complaint of the U. M. W. A., and they make the usual statutory declaration that unless the grievance is adjusted a strike will take place.

The Company have replied to the application in a very brief document. They say that no discrimination has taken place, but assert the right of the management to give preference of employment as the Company see fit. The reply says that recently, owing to dulness of trade, there has not been employment for all, and preference has been given in dispensing employment to members of the P. W. A., with which body the company have a contract for two years, and to which the majority of their workmen belong. The company state the prosperity of the Nova Scotian industry depends on its ability to meet American competition in Canadian market; that it would be most prejudicial to the industry of the workmen employed were under the control of a foreign union such as the U. M. W. A. having its headquarters in the United States. The reply concludes as follows: "It is a well-known fact that the coal

operators of the United States are making strenuous efforts to oust Nova Scotian coal from the St. Lawrence markets, and the Dominion Coal company is determined to protect its business and the vital interests of its employees by preventing this foreign labour union from exercising control over the majority of its workmen."

The Coal Company have refused to appoint a representative on the Board, and the Government have appointed Mr. Geo. S. Campbell, of Halifax, to act in this capacity. In granting the application, the Government appointed as the U. M. W. A. representative on the Board a person who is the local president of the U. M. W. A., and who is furthermore one of the persons against whom discrimination is alleged on the part of the Coal Company. The appointment is one that is open to justifiable criticism, and it can only be surmised that the department was misinformed when it made the appointment. If the appointment was made with a true knowledge of the facts, it makes a farce of the whole proceeding, and the precedent, if followed, will speedily negative the usefulness of the Industrial Disputes Act. It is understood, however, that the department acted under a misapprehension of the circumstances. The chairman, at the time of writing, was not appointed.

This Board of Conciliation will have an unusual task to perform, inasmuch as no dispute exists as the term is generally used. There is no question of wages or hours to be adjudicated upon, and there can be but little doubt that the framers of the Industrial Disputes Act had not foreseen the possibility of the Act being used as a means to force the recognition of a foreign trades union. Indeed, it is a little difficult to see how the terms of the Industrial Disputes Act can be said to cover the application of a foreign trades union, because the actions of such a union are beyond the purview and the jurisdiction of the Canadian law courts. The headquarters of the U. M. W. A. are in the United States, and all the members of the union must be governed by the orders which emanate from headquarters, or they cease to become members. Being outside the jurisdiction of the Canadian courts, the pains and penalties of the Act cannot apply to the officers of a foreign union, and it is difficult to see why the converse should not be true. The rulings of the Supreme Court of Canada would not be regarded in Indianapolis, but, under the constitution of the U. M. W. A. the rulings of Indianapolis must be obeyed in Canada. Herr Bebel, the leader of the Sozial-Demokratik party of Germany, might as fairly ask for the intervention of the Department of Labour as Tom Lewis, of Indianapolis. The cases are perfectly analogous.

## ONTARIO.

**Cobalt.**—In the March 15th correspondence it was stated that the Toledo Mines Co. had purchased a plant from the Sullivan Machinery Company. This was not the case, the plant in question being supplied by the Canadian Rand Co.

By far the most important find of the year in Cobalt was made by the Nipissing Mines Co. in their No. 64 shaft at a depth of 172 feet. The men were cutting out a station at this level when the vein was found, and the dip is such that it will come into the shaft a short distance below the stations. The vein matter is smallite, niccolite and native silver, with small amounts of bismuth. The vein varies in width from 13 to 30 inches, and will average about 22 inches. The ore is high-grade, and will assay several thousand ounces to the ton. While cutting out the station 13 tons of ore were taken out. No. 64 shaft is situated a few hundred feet east of the Temiskaming & Hudson Bay shaft, and the vein is supposed to be a continuation of one worked by the latter company. Several hundred feet of prospecting drifts on the 80-foot level failed to show any signs of the vein.

Great interest has been aroused by the new find made at the Cobalt Lake. On March 15th, when working in the west cross-cut from No. 6 shaft, at a depth of about 133 feet, a high-grade silver vein from 2 to 12 inches in width was discovered. A round of holes was fired on Saturday night, when coming off shift, but the ore was not discovered till Monday morning, when the men went in to do the mucking. The vein cuts the cross-cut at a slight angle, and is supposed to be a continuation of one of the McKinley-Darragh veins.

No. 8 vein of the Coniagas mine, which gave good results on the 75-foot level, has been struck again on the 150-foot level. The vein carries high values, and the wall rock is highly mineralized. The company's concentrator is treating about 80 tons of ore a day and produces one car of concentrates a month, assaying in the neighborhood of 2,000 oz. per ton. The shipments of the mine are very regular, and average one car of high-grade ore and one car of concentrates a month. The ore is treated by the smelter at Thorold, which is owned by the Coniagas people. A force of over one hundred men is employed at the mine.

Extensive development work is being carried on at the Trethewey mine, and the company also have a contract with the T. & H. B. mine, whereby the latter company is drifting in the 150-foot level on a continuation of one of their veins, in Trethewey ground. A small concentrating plant is in operation, and this month the company has shipped two cars of high-grade and one of low-grade ore to the smelters. A new jig and a concentrator table has been added to the ore-house. A force of 60 men is employed on the property.

Considerable development work is being done in No. 3 shaft of the Right of Way. At the 75-foot level the cross-cut running northeast has been driven over 200 feet, and the management expect to strike a good vein shortly. The vein has been traced on the surface, and was also worked by the Silver Queen, where it showed high values. A winze is being sunk from the present workings, and is now down 35 feet. It will be continued till a depth of 75 feet is reached. In No. 2 shaft, which is the main working of the mine, the new vein on the north side is being followed on the second level. This vein was found about a month ago, and has been drifted on for over 70 feet, and it carries high-grade ore. Very little stoping is being done on the property, most of the ore coming from development. A force of 90 men is employed:

Another strike has been made at the Chambers-Ferland, a 5-inch vein of cobalt having been discovered in the workings from No. 2 shaft.

The new 14-drill tandem compound air compressor for the Crown Reserve is now on the ground, and will be installed shortly.

The annual report of the Temiskaming mine has been issued, and shows a production for the year of 831 tons of ore, which produced 1,026,285 oz. of silver of a net value of \$494,211.46. A new plant with a greatly increased capacity has been installed, which will enable the company to carry on their mining operations on a much larger scale than heretofore. No. 1 shaft has been continued from the 200 to the 250 foot level, and the new No. 2 shaft with three compartments has been sunk to the 200-foot level.

A new strike has been made at the Columbus mine in the 250-foot level of the main shaft. Some time ago the mine was flooded by a subterranean body of water, but this has been pumped out and work resumed.

At the Kerry Mining Company's lease at Cart Lake a strike of importance was made on March 14th in the north cross-cut at the 100-foot level of their No. 1 shaft. The vein is calcite, carrying values in native silver. At the company's lease on

Peterson Lake, a station is being cut at the 125-foot level in preparation for drifting on a vein of calcite and native silver. The company intends to order new boilers and a compressor, as their present plant is inadequate to handle the work. A force of 40 men are at work on the property.

The Davis property, north of the Shamrock, has been leased to Mr. Bilsky, of the Nova Scotia, and his associates. They will obtain air from the Badger mine, the pipe for which is now being laid. Drills have been purchased, and work will be commenced as soon as air is ready for delivery at the mine.

A contract has been let to sink a 100-foot shaft on the property of the Eastbourne Cobalt Mining Co., located near the Badger mine. Several promising veins have been encountered in surface prospecting, and it is on one of these that the shaft will be sunk.

The Alexandria mine has struck good ore at the 170-foot level of the shaft. The vein was encountered at a depth of 160 feet, but at that time was only a very narrow stringer of calcite, but it subsequently widened and showed good silver values. The shaft will be sunk to the 200-foot level, when a cross-cut will be run to tap the No. 2 Bailey vein, lying about 60 feet south of the shaft. This vein shows up well on the surface. The present compressor is too small to do the work required, so a larger one will be installed.

The new compressor and gas producer plant recently installed at the Keeley mines will be ready to start in a short time. Silver has recently been struck in the No. 2 shaft.

The John Black Mining Co. is putting in a small boiler and hoist for development work.

The Bailey mine intends to put in a plant in a short time.

The Silver Cross Mining Co. has purchased a 60 h.p. boiler and a 3-drill compressor. The company intends to carry on the work on a larger scale than formerly.

Twelve men are employed at the Gifford mine sinking the shaft, which is now down to a depth of 75 feet. The shaft will be sunk to the 200-foot level before any drifting is done. Air for one drill is supplied from the Temiskaming mine, and the hoist is run by a small boiler.

Montreal and Buffalo capitalists have incorporated the Goodwin Lake Mines Co., the holdings of which consist of two hundred acres in the western edge of Lorraine Township. The company intends to push the development work as rapidly as possible.

The Quaker City Cobalt Mines, which have been closed down for the past year, have resumed operations. A 30 h.p. boiler, hoist, pump and two drills are now on the ground, and will be ready to commence operations about the last of March. A shaft 40 feet deep has been sunk on a calcite vein, and the company intends to continue sinking until a depth of 150 feet is reached. At that depth drifts will be run in the vein, and cross-cuts to tap parallel veins which show on the surface.

The Cobalt Rosario Mining Co., which owns two 20-acre claims in the vicinity of Iron Lake, Coleman Township, are sinking two shafts, one of which is down 35 feet, and the other 15 feet. They will be continued to the 100-foot level. The company has been doing surface prospecting since last summer and has shown up some calcite veins.

The Century mine in Bucke Township has bought a three-drill compressor and a 60 h.p. boiler. The machinery is now being installed, and it is expected that it will shortly be in operation.

Considerable work is being done by the Cobalt Mutual Mining Co. operating in Bucke. A contract has been let for one hundred feet of drifting from the lower level of the shaft on the claim located in Lot 1.

A force of ten men is doing development work on the property of the Haileybury Silver Mining Co. in South Lorraine. Drifts are being driven on the vein at the 72-foot level in No. 2 shaft. The vein is from four to five inches in width, but does not carry much silver at the present time.

W. H. Hayden, consulting engineer for the Elk Lake Cobalt Mines of Ontario, in the Elk Lake District, is putting in duplicate plants on two of the company's properties. Each plant will consist of a 60 h.p. locomotive boiler, a three-drill straight-line Rand compressor, a hoist and drills. Mr. Hayden is also putting in a similar plant for the Temagami Cobalt Mines of Ontario.

A force of 16 men is at work in the Devlin mine, Elk Lake, sinking two shafts, which will be continued to a depth of 100 feet. The company expects to be in a position to install machinery by next summer.

The Wettlaufer mine in South Lorraine has purchased two 60 h.p. locomotive boilers, a compressor and hoist.

The Montrose Syndicate Mines, operating in the same district, intend putting in a small plant for development work.

Mr. J. W. Ford, of Haileybury, has put in a small plant at his mine, located out near the Temiskaming.

Considerable activity is being displayed in the Larder Lake District, and machinery and supplies are being sent in over the road. The Reddick mine will install a gas producer, which will run the compressor. Fifteen men are working on the property, but a much larger force will be employed in the near future. The Victoria Creek Mining Co. are opening up properties with a force of fifteen men. A shaft, which will be sunk to a depth of 100 feet, is now down 40 feet.

Silvers, Limited, in Gowganda, have ordered a small plant. Work on the property will be pushed as rapidly as possible, and a carload of machinery and supplies has been shipped. A contract has been let for sinking a 100-foot shaft, and 100 feet of drifting from that level. The shaft is now down a short distance on the vein, which carries exceedingly high silver values.

Mr. C. A. Foster is putting in two 25 h.p. plants on his properties in Gowganda.

Twenty men are employed in mining operations at the Gowganda Queen mines, whose property consists of seven claims in the Gowganda District. Permanent camps have been erected, and excellent progress made with the development work.

The Cragg Mines, of Gowganda, have made an important strike. A vein three inches in width and carrying high silver values has been discovered and stripped for over fifty feet. A tunnel will be run to tap the vein at a depth of 100 feet.

The shaft on the Mann property is down over 25 feet, and will be sunk to the 100-foot level before a station is cut. Another shaft on the north lot will be sunk to the same depth. Two 25 h.p. plants are being installed, and a force of men are at work erecting additional camps.

A 10 x 6 vertical shaft is being sunk on the Boyd-Gordon property. Three veins are showing in the shaft which is now down to a depth of over 45 feet. These veins show very high values and considerable ore is already bagged ready for shipment. The ground, west of the shaft, is being cleared preparatory to starting an open cut, which will be worked while the shaft is being sunk to the 100 foot level. Over thirty men are at present employed on the property.

A shaft has been started on Captain Munn's property, south of the Bartlett Mines.

A good deal of the machinery for the Bartlett Mines is now on the ground, and the boilers are being brought in.

The Nipissing Central Railway Co. has asked for a franchise to build an electric road between Cobalt and Haileybury. The company guarantees that the road will be started by May 15 and finished November 1, 1909. A half hourly service would be maintained between the two towns. The line would be a great boon to the two towns, and particularly to those people who work in Cobalt, and who would live in Haileybury if possible, as the latter town is much preferable as a place of residence.

## BRITISH COLUMBIA.

**Roseland.**—The Le Roi 2, Ltd., which has just paid a regular quarterly dividend of two shillings per share, earned net profits of \$53,053 for the year 1907-8, exceeding the two previous fiscal years, when the figures were \$41,604 (1905-6) and \$12,555 (1906-7). The dividends paid during the three years mentioned amounted to \$37,800, against \$37,800 and \$12,600 respectively.

A good strike has been made on the ninth level of the War Eagle mine. The vein opened up at this point is forty feet wide and approximately 400 feet in length. Assays made so far show the ore carrying \$20 to \$100 in gold and copper. Large quantities of rich ore are being stoped from the eleventh and twelfth levels of the Centre Star mine, and from the four good ore shoots in the Iron Mask ground. The Trail smelter has entered into a long contract with the Le Roi 2, Ltd., for the treatment of its product, the arrangement during the past contract having proved profitable to both concerns. The Trail smelter is now treating 40,000 tons of ore per month, the gross value of the output per month being \$400,000 or \$4,800,000 per annum, approximately, of which about 40 per cent. is gold, silver 22 per cent., lead 22 per cent., and copper 16 per cent. Nearly all of the ore treated at this reduction works is derived from the mines of the Consolidated Co. itself.

The Le Roi mine was closed down for an indefinite period upon the return of A. J. McMillan, managing director, from London, last week. The working arrangements at the mine were somewhat unsatisfactory, as very little headway could be made in the affairs of the company as long as the shipments were so light. Mr. McMillan will return to England with Mr. W. A. Carlyle, consulting engineer, and if possible arrangements will be made to raise capital with which to explore the Le Roi ground as it should be explored. It is thought that the outcome of this move will be the organization of a company with sufficient capital to buy other mines, as well as do extensive development. In this way the Northport smelter could be run to its full capacity, and, with the installation of several modern appliances, on an economical basis.

Work has been suspended on the Giant-California group for an indefinite period.

**Boundary.**—Ore production at the Granby mines is up to the full capacity of the seven furnaces now working at the Grand Forks smelter; in fact, there is a surplus of ore in the bins at the smelter, which has necessitated the mines closing down an occasional Sunday. The production at the Mother Lode mine of the B. C. Copper Co. is going along steadily, but there was a cessation of operations at the Oro Denoro a few days last week.

At the Snowshoe mine the working force was reduced during the past seven days, as owing to a surplus of ore on hand at the Trail smelter shipments from this mine had to be curtailed.

In a report on the Dominion Copper Company's property, made in June last, F. A. Provot gives a few facts of interest concerning the costs for mining, smelting, etc. There is a probable ore reserve in the Rawhide and Idaho claims of this company of between two and three million tons of ore, which should average \$1 in gold, 18c silver and 22 lbs. copper, and which will very likely give a net recovery of 17 lbs. copper and \$1.15 in gold and silver to the ton. During the year ending July 31,

1907, the recovery was \$1.04 gold, silver 15c, copper 15.5 lbs. The copper recovery was rather low, owing to the large amount of Sunset ore, useful as a flux, put through the smelter to keep up the supply for the furnaces. Estimating what the Dominion Copper Co. could do, Mr. Provot says that treating a tonnage of 300,000 tons per annum they could mine and produce copper at the following figures: Cost of mining the ore per ton, \$1.25; smelting, \$1.38; converting, refining and marketing as per contract with the B. C. Copper Co., 3c per lb.; 17 lbs. would be 51c, making a total cost of \$3.14. Deducting \$1 for the value of the gold and silver would leave \$2.14 for the 17 lbs. copper per ton, or about 12c per lb. From this it will be seen that with copper at a normal figure, say 15c per lb., a profit of about \$120,000 per annum, could be realized. In all of the other mines of the Dominion Company than the Rawhide and Idaho extensive development work should be undertaken before the company would be warranted in making the necessary additions to the smelter. It would take \$50,000 to \$75,000 to place enough ore in the probable stoping areas of the different mines to warrant the resumption of operations and the installation of much-needed mining and smelting facilities.

A Boston company, F. W. Mason & Co., have sent a letter to the shareholders of the Dominion Copper Co., in which they voice the opinion that the right of the Reorganization Committee to sell the property of the company should be invalid after reorganization has been accomplished. This concern also thinks that the old shareholders should receive a bonus of 40 or 50 shares of the new stock when subscribing for the bonds instead of 10 shares. Their first contention seems sound, and the second is worthy of consideration. Reorganization is too often a game of "freeze-out" for the men who have put their good money into mining and industrial companies. The old shareholders should be able to get into the reorganized company on a good and fair basis, and it is only a matter of time until government supervision of corporations will control this feature of reorganization.

The Provincial Government has granted a charter to the Greenwood Tunnel-Tramway concern.

On the Bounty Fraction, near Beaverdell, high-grade galena ore is being taken from the new vein recently opened up, which is over three feet wide on an average.

**Slocan-E. Kootenay.**—The decision of the Supreme Court of the United States, removing the duty from zinc imported into that country, will very likely result in a large amount of zinc

ore being shipped to United States points pending the enlargement of the Nelson electric smelter.

The Consolidated Mining & Smelting Co. has taken a two and one-half years' lease on the Queen Victoria mine, near Nelson. Shipments and development work will be started as soon as things can be got in shape.

The greater part of the Silver King mine at Nelson has been unwatered, and the force is being augmented. Steady shipments will be made to Trail smelter as soon as the tramway can be put in good condition and stoping begun.

M. Davys has secured the Tiger group at a price of \$80,000, and will have arrangements completed to begin work on the property by the first of June. The group contains six claims.

It is understood, through advice received from London, that the Ymir Gold Mining Co. is putting out an issue of \$2,000,000 common stock. This will probably be used to raise capital with which to further develop the company's property.

What is known as the Echo group, comprising the Echo, Echo Fr., St. Elmo, Idaho, Portland and Ontario mining claims in the Sheep Creek district, have been bonded by Wm. Maher, of Nelson from the owners, who are Nelson, Rossland and Trail mining men. This property is situated on Summit Creek about four miles from the Mother Lode and Queen groups.

The Iona group of claims has been bonded by H. L. Rodger, of Spokane, for \$10,000. Work is to be commenced right away.

The International Coal & Coke Co. shipped 46,427 tons of coal during February, averaging over 2,000 tons for every working day. The net profit on the operations of the company last year was approximately \$275,000, after paying a dividend that absorbed about half of this amount the company shows a surplus of \$600,000 on the books.

**Vancouver.**—Operations are about to be resumed at the Ladysmith smelter. The plant will be operated to its full capacity this season.

Four claims have been staked by J. McCuish and Chas. Newman, on which there is a good showing of ore similar in character to that found in the Rossland district, although somewhat richer. Samples recently assayed show \$18 in gold, 25 oz. silver and something under 1 per cent. copper.

Jas. Cronin, erstwhile managing director of the St. Eugene, is deeply interested in a group of silver-lead mines in the Babine Mountain district. Work is to be started on this group as soon as the season opens.

## GENERAL MINING NEWS.

### NOVA SCOTIA.

**North Sydney.**—Rev. M. A. McPherson, of Little Bras d'Or, who has had a gang of men prospecting for coal at Leitches Creek, a few miles from here, has found a seam of anthracite coal eight feet thick, with every indication of a large quantity.

### NEW BRUNSWICK.

**Campbellton.**—A company composed of Gloucester and Kent County men was formed last fall to explore lands in the St. Isidore district. Considerable preliminary work was done last fall, and this winter the government drill has been at work. At various depths seams of coal have been bored through, one being over two feet thick. Now at a depth of five hundred feet a seam four feet thick has been bored through. It is probable the deposit may be developed.

### ONTARIO.

**Cobalt.**—A vein 21 inches in width, of smaltite and native silver, was found in No. 64 shaft of the Nipissing at the 175 foot level. This is the first shipping ore located in this shaft, which is situated near the T. & H. B. line.

During February the Nipissing mined ore of an estimated value of \$144,384, and shipped ore of an estimated value of \$190,640. The important developments of the month included the striking of ore in a raise from the 210 foot level of vein No. 26; the cutting of veins Nos. 72 and 101 at depths of 75 feet; and the continued good showing at the Fourth of July shaft.

The structural steel for the new shaft at the Temiskaming is now being hauled in. There will be a large quantity of second grade ore available for the concentrator, which the Temiskaming is to erect before the summer is over.

The Muggley concentrator has finished milling several thousand tons for the Nova Scotia mine.

The main shaft of the Nova Scotia is down 235 feet in the same ore as found in the new vein last summer. No. 5 and No. 6 levels, which are now 75 feet apart, are being connected up. No. 5 is down 160 feet. There are now 130 men at work on the property.

A new vein has been struck on the Cobalt Lake property running parallel with the drift from No. 6 shaft. The vein runs along the McKinley-Darragh boundary, but is not the McKinley-Darragh vein, as the shaft will have to be continued about fifty feet farther to cut the McKinley vein. The new vein is one foot wide and carries high silver values.

The appeal of the Coniagas Mines, Ltd., and of the Coniagas Reduction Co., against the freight rates of the Grand Trunk on ore shipped from the mines to the smelter in Thorold, has been set by the railway commission for hearing in Toronto in May.

The February shipments comprised 17 mines, with 71 cars, containing 2,103.85 tons, or an average of 79 tons per mine. For February, 1908, the shipments were 1,184.53 tons, so that the 1909 shipments are nearly double those of 1908.

A vein four to six inches wide was caught in a circular cross-cut, 65 feet from the west cross-cut at the 80 foot level of No. 2 shaft on the Chambers-Ferland, at a point 275 feet from the shaft. The vein has been drifted on to the north of the cross-cut for twenty-five feet. At this point the drift is between the walls of an eighty foot ore body suitable for concentrating purposes.

A four inch vein of calcite was found at the 100 foot level on the Cart Lake lease of the Kerry Mining Co., about 120 feet distant from the shaft.

At the Coniagas, No. 8 vein, which was rich on the 75 foot level, was located on the 150 foot level, and, although narrow, shows very rich ore.

**Elk Lake.**—Elk Lake is at present in the midst of its first mayoralty campaign. There are in the field two well-known and highly respected citizens in the persons of Mr. Ludger Joudouin, general merchant, and Mr. John Munroe, pioneer locator and ex-pugilist. Either candidate should make a good mayor and will undoubtedly change the complexion of affairs around Elk Lake.

At the 60 foot level No. 1 vein on Elk Lake Discovery has widened to three inches of ore.

The mining recorder here has recorded over 300 claims in the Shining-tree district to date. According to reliable informants there have not been many bona-fide discoveries.

**Gowganda.**—It has been officially announced by the C. P. R. that a canoe freight route will be established to Gowganda from Bisco, on the C. P. R. main line, 35 miles west of Sudbury.

The Government has made public the tenders received for Gowganda townsite lots. Over 500 tenders were received. One hundred and twenty lots were undisposed of. 130 lots are to be sold for \$17,664.50, or an average price of \$136. The highest bid was \$412, and the lowest accepted was \$25. The successful tenderers include parties in Toronto, Ottawa, Montreal, and New York.

In anticipation of a building boom enormous supplies will be rushed to the town as soon as the Government makes public its transportation policy.

#### BRITISH COLUMBIA.

**Rossland.**—A strike of considerable importance has been made in the War Eagle, in the ninth level. Drifting has shown the new vein to be 40 feet wide and 400 feet long, containing

heavy sulphides, with high gold values. This same vein has been productive on the tenth level, and while no work has been done on it in the upper levels it is thought the ore will extend several hundred feet above the ninth level and possibly to the surface.

Rich ore has been found on the eleventh and twelfth levels of the Centre Star in some of the larger stopes. During February the Centre Star made profits of \$30,000.

Recent developments on the Idaho have been most profitable. On the fourth level a stope 150 feet long by from 20 to 30 feet wide is producing a good tonnage of heavy sulphide ore, containing about ten dollars in gold, besides good values in copper and silver. On the main vein stoping is being continued westward, recent values in the west drift having been high.

Three furnaces are running at the consolidated company's smelter at Trail, treating about 1,000 tons of copper ore per day, from which are being produced six hundred tons of copper matte per month, containing \$240,000 worth of gold. The lead furnace averages 200 tons of ore per day. The lead refinery at Trail is producing 2,000 tons of pig lead per month, and is shipping close to 250,000 ounces of refined silver to China each month.

Pending arrangements for the exploration of the property down to 2,500 or 3,000 feet from the surface, the Le Roi mine has laid off a number of men. The exploration work carried on for some months past has proved disappointing, and it has been decided to suspend operations until arrangements are made for carrying out a large and comprehensive plan of exploration and development.

**Phoenix.**—Seven furnaces are at present in operation at the Granby, the enlargement of the second battery not being completed as yet. The mines have been more than supplying the requirements of the smelter in ore, all the bunkers being filled at present and some 75 loaded cars on a siding.

**Greenwood.**—One of the biggest mining deals in British Columbia for some months past was closed recently, when the Granby Smelter Company purchased large copper claims on Moresby Island, near Queen Charlotte Island, for \$100,000. It is likely another smelter will be erected similar to their present works here.
